DTSC-200A
ATS Controller - Configuration

Configuration
Release 1.1 - 0

Document ID: 37940, Revision C

WARNING

Read this entire manual and all other publications pertaining to the work to be performed before installing, operating, or servicing this equipment. Practice all plant and safety instructions and precautions. Failure to follow instructions can cause personal injury and/or property damage.

The engine, turbine, or other type of prime mover should be equipped with an overspeed (overtemperature, or overpressure, where applicable) shutdown device(s), that operates totally independently of the prime mover control device(s) to protect against runaway or damage to the engine, turbine, or other type of prime mover with possible personal injury or loss of life should the mechanical-hydraulic governor(s) or electric control(s), the actuator(s), fuel control(s), the driving mechanism(s), the linkage(s), or the controlled device(s) fail.

Any unauthorized modifications to or use of this equipment outside its specified mechanical, electrical, or other operating limits may cause personal injury and/or property damage, including damage to the equipment. Any such unauthorized modifications: (i) constitute "misuse" and/or "negligence" within the meaning of the product warranty thereby excluding warranty coverage for any resulting damage, and (ii) invalidate product certifications or listings.

CAUTION

To prevent damage to a control system that uses an alternator or battery-charging device, make sure the charging device is turned off before disconnecting the battery from the system.

Electronic controls contain static-sensitive parts. Observe the following precautions to prevent damage to these parts.

- **Discharge body static before handling the control (with power to the control turned off, contact a grounded surface and maintain contact while handling the control).**
- **Avoid all plastic, vinyl, and Styrofoam (except antistatic versions) around printed circuit boards.**
- **Do not touch the components or conductors on a printed circuit board with your hands or with conductive devices.**

OUT-OF-DATE PUBLICATION

This publication may have been revised or updated since this copy was produced. To verify that you have the latest revision, be sure to check the Woodward website. The revision level is shown at the bottom of the front cover after the publication number. The latest version of most publications is available at:

http://www.woodward.com/publications

If your publication is not there, please contact your customer service representative to get the latest copy.

Important definitions

WARNING

Indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury.

CAUTION

Indicates a potentially hazardous situation that, if not avoided, could result in damage to equipment.

NOTE

Provides other helpful information that does not fall under the warning or caution categories.

Revision History

Rev.	Date	Editor	Changes
C	2024-11-12	Ma	**NEW Software Revision Release 1.1-0 or higher** **NEW features & functions** • Additional S1/S2 breaker closure monitor – Refer to “Monitor breaker closing” • Introduction of new LM flags for logic and visualization purposes - Refer to “Logical Command Variables: [20.00] - ATS Status Flags 2” • Introduction of French language in HMI
B	2023-30-05	Koe	1.0-4 Bug fix release, SW Handoff 53195 • Fixed a bug where pressing some keys in the HMI moved the device to a state where it did not open/close breakers anymore • fixed a bug where the device sometimes crashed when accessed via ModbusRS485 with an invalid address • fixed a bug where the device’s nonvolatile parameters were incompletely initialized after first startup, at production site • fixed a bug, where display of P/Q/S/I values in the device’s HMI was inconsistent between S1 and S2, if current transformers were set to values >=1000A
A	2022-31-03	Ma	- Based on DTSC-200 V2.0017 - Hysteresis overload monitoring has been corrected. Refer to chapter overload monitoring.

Table 1-1: Manual - overview

Intended Use: The unit must only be operated for the uses described in this manual. The prerequisite for a proper and safe operation of the product is correct transportation, storage, and installation as well as careful operation and maintenance.

NOTE

This manual has been developed for a unit fitted with all available options. Inputs/outputs, functions, configuration screens and other details described, which do not exist on your unit, may be ignored.

The present manual has been prepared to enable the installation and commissioning of the unit. On account of the large variety of parameter settings, it is not possible to cover every possible combination. The manual is therefore only a guide. In case of incorrect entries or a total loss of functions, the default settings can be taken from the enclosed list of parameters at the rear of this manual.

Chapter 2.
Configuration

Configuration Via Front Panel

Operation of the unit via the front panel is explained in the operation manual. This manual will familiarize you with the unit, the meanings/functions of the buttons, and the display.

Configuration Via PC

Install ToolKit Configuration and Visualization Software

NOTE

Woodward's ToolKit software is required to configure the unit via PC.

Install ToolKit Software

Woodward's ToolKit software is required to access the unit via PC
• Required version: 6.4 or higher
• Please use the latest available version!
• To obtain the latest version scan this QR code or use the following link:

⟹ https://wss.woodward.com/manuals/PGC/SW_Tools/ToolKit.

NOTE

Microsoft .NET Framework 4.0 must be installed on your computer to be able to install ToolKit. If not already installed, Microsoft .NET Framework will be installed automatically. You must be connected to the internet for this. Alternatively, you can use the .NET Framework installer which can be found on the Product CD.

Install ToolKit Configuration Files

Configuration files and Technical Manual are available on a Woodward server. Refer to chapter QR Code.
The latest versions are available at the Woodward web site.

- Configuration
  - msi-file (installing application files and ToolKit)
  - eds-file (zipped)
- Technical Manual (PDF)

NOTE

ToolKit is using the following files:

***.WTOOL**
File name composition: [P/N1]*1-[Revision]_[Language ID]_[P/N2]*2-[Revision]_[# of visualized gens].WTOOL
Example file name: 8440-1234-NEW_US_5418-1234-NEW.WTOOL
Content of the file: Display screens and pages for online configuration, which are associated with the respective *.SID file

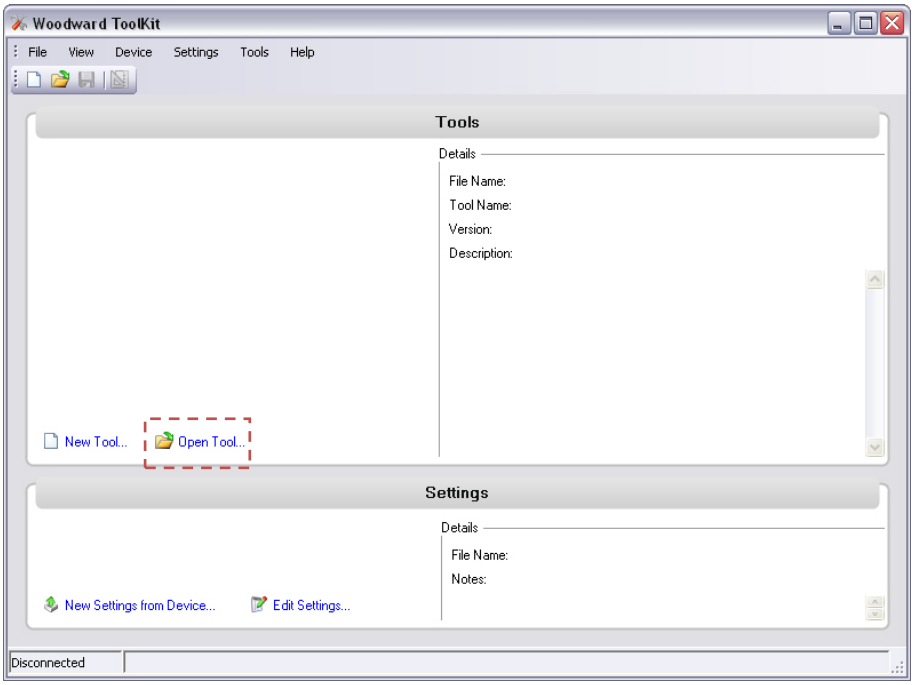
***.SID**
File name composition: [P/N2]*2-[Revision].SID
Example file name: 5418-1234-NEW.SID
Content of the file: All display and configuration parameters available in ToolKit

***.WSET**
File name composition: [user defined].WSET
Example file name: DTSC-200_settings.WSET
Content of the file: Default settings of the ToolKit configuration parameters provided by the SID file or user-defined settings read out of the unit.

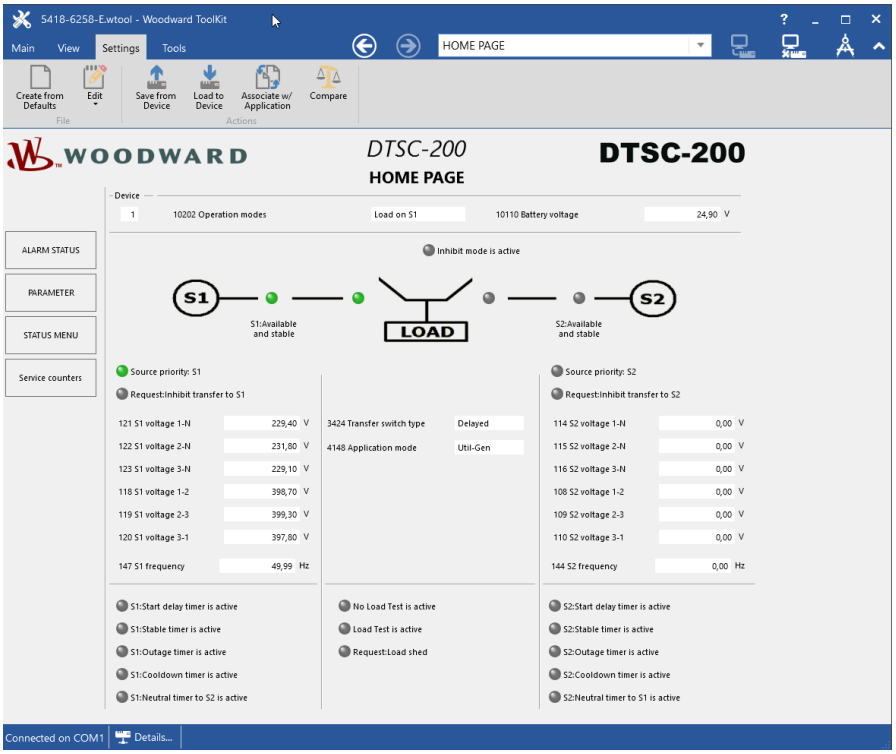
***1 P/N1 = Part number of the unit**
***2 P/N2 = Part number of the software in the unit**

Starting ToolKit Software

1. Start ToolKit via Windows Start menu -> Programs ->Woodward -> ToolKit
2. Please press the button “Open Tool”

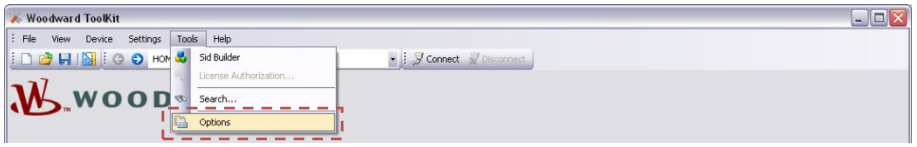


3. Go to the “Application” folder and open then the folder equal to the part number (P/N) of your device (e.g. 8440-1234). Select the wtool file (e.g. 8440-1234-NEW_US_5418-1234-NEW.wtool) and click “Open” to start the configuration file
4. Now the home page of the ToolKit configuration screen appears



Configure ToolKit Software

1. Start the configuration by using the toolbar. Please go to Tools -> Options



2. The options window will be displayed

   a. Adjust the default locations of the configuration files
   b. The displayed language can be selected here
3. The changes become effective after clicking “OK”

NOTE

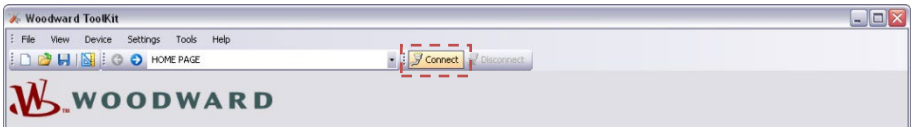
Please use the ToolKit online help for further information.

Connect ToolKit and the DTSC200A Unit

For configuration of the unit via ToolKit please proceed as follows:

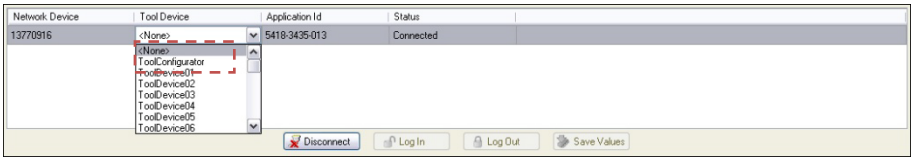
1. Plug the USB cable into your windows compatible computer and into the DTSC200A device. The USB driver should be automatically recognized. Check your Device Manager for proper running.

2. *Open ToolKit via Windows Start menu -> Programs -> Woodward -> ToolKit*
3. *From the main ToolKit window, click File then select "Open Tool"..., or click the Open Tool icon*  *on the tool bar.*
4. *Locate and select the desired tool file (*.WTOOL) in the ToolKit data file directory and click Open.*
5. From the main ToolKit window, click Device then click "Connect", or select the Connect icon  on the toolbar.



6. The connect dialog window will open if the option is enabled.

   a. Select the COM port that is connected to the communication cable.
   b. Click the "Connect" button.
7. The identifier of the device that ToolKit is connected to, will display in the status bar.
8. If the Communications window opens, select "ToolConfigurator" under Tool Device and close the Communications window.



9. If the device is security enabled, the Login dialog will appear.
10. Now you are able to edit the DTSC-200A parameters in the main window. Any changes made are written to the control memory automatically.

SID Files for Using ToolKit on the CAN Bus with other CANopen Devices

If a PC with ToolKit is connected to the DTSC-200A via a CAN bus with other external CANopen devices (like a Phoenix Contact I/O expansion board, for example), it may happen that ToolKit cannot establish a connection with the DTSC-200A because it looks for a SID file for such an external device, which does not exist.
A special *.sid file can be created in this case. Contact Woodward for support or create a *.sid file with the following content:

```
<?xml version="1.0" encoding="utf-8"?>
<ServiceInterfaceDefinition xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" Identifier="[add the required device application name here]" Specification="EmptyFile">
</ServiceInterfaceDefinition>
```

The file name must be the same as the Identifier plus the extension *.sid. The file must be stored to the configured SID file directory.

NOTE

Depending on the computer used and the installed operation system, problems with the communication via an infrared connection may occur.

NOTE

If your computer is equipped with a Bluetooth interface please deactivate it temporarily in the Windows system control menu in the case that ToolKit is freezing building up a connection.

NOTE

It is also possible to connect to the unit via CAN bus. If a suitable CAN adapter is used, this may be selected in the Connect window. We recommend using the IXXAT USB-to-CAN converter using the VCI V3 driver.

Be sure to configure the correct baud rate and timeout in the Properties dialog of the Connect window.

The Password for CAN Interface 1 (parameter 10402 on page 121) must be entered before being able to edit the parameters.

View DTSC-200A Data with ToolKit

The following figure shows an example visualization screen of ToolKit:

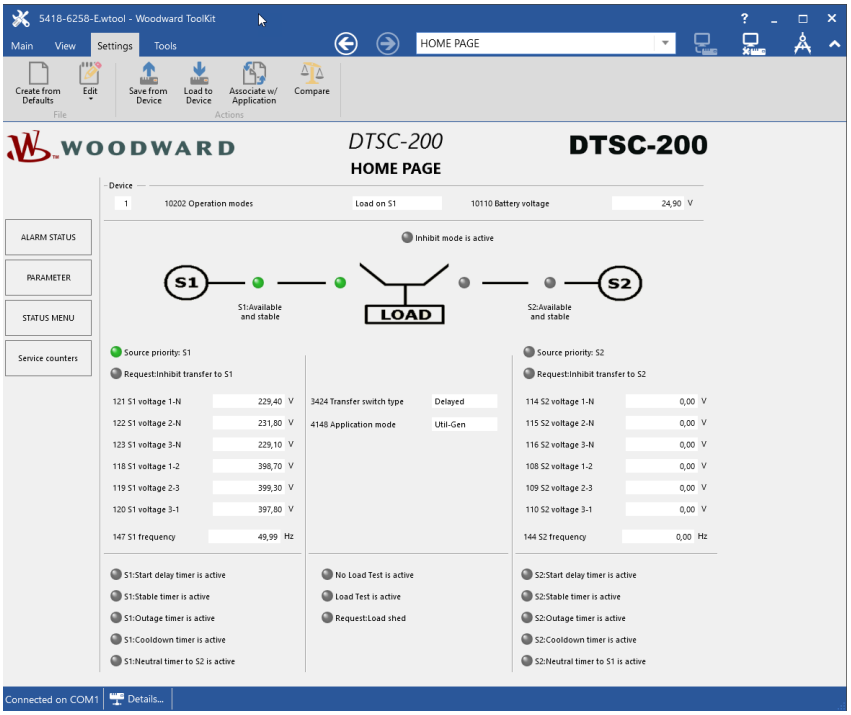


Figure 2-1: ToolKit - visualization screen

Navigation through the various visualization and configuration screens is performed by clicking on the and icons, by selecting a navigation button (e.g. STATUS MENU), or by selecting a screen from the drop-down list to the right of the arrow icons.
It is possible to view a trend chart of up to eight values with the trending tool utility of ToolKit. The following figure shows a trending screen of the measured battery voltage value:

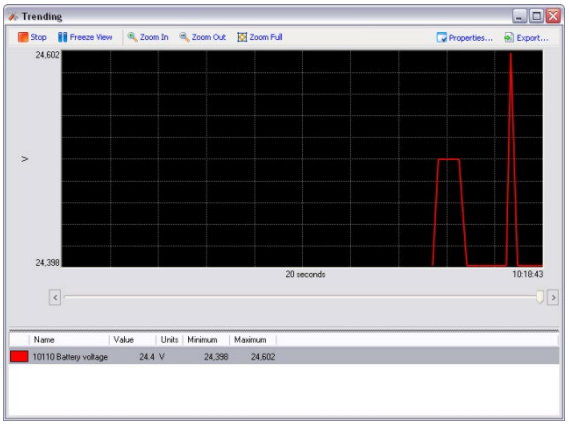

Figure 2-2: ToolKit - analog value trending screen

Each visualization screen provides for trending of monitored values by right-clicking on a value and selecting the "Add to trend" function. Trending is initiated by clicking on the Start button. Clicking the Export… button will save the trend data to a Comma Separated Values (CSV) file for viewing, editing or printing with office software, like Microsoft Excel, etc. The Properties… button is used to define high and low limits of the scale, sample rate, displayed time span and color of the graph. The trend functionality is not available if ToolKit is used utilizing a CAN bus connection to the unit.

Configure the DTSC-200A with ToolKit

The following figure shows an example configuration screen of ToolKit:

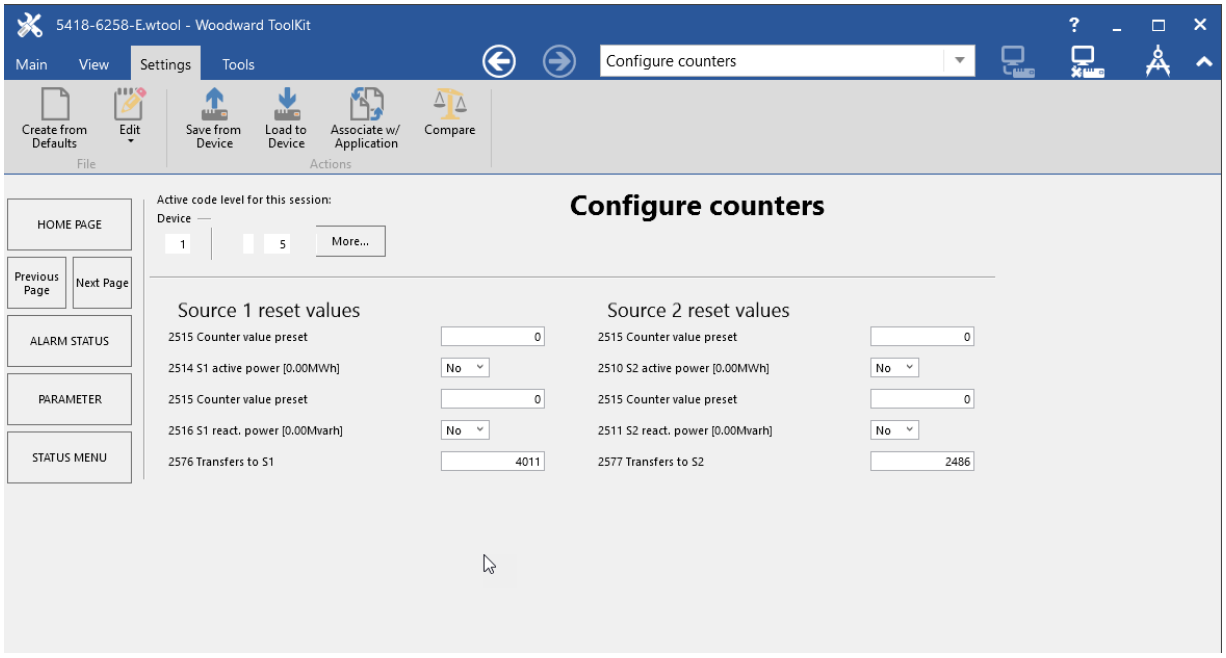

Figure 2-3: ToolKit - configuration screen

Entering a new value or selecting a value from a defined list will change the value in a field. The new value is written to the controller memory by changing to a new field or pressing the Enter key.

Navigation through the various configuration and visualization screens is performed by clicking on the and icons, by selecting a navigation button (e.g. STATUS MENU), or by selecting a screen from the drop-down list to the right of the arrow icons.

General Information

The DTSC-200A has been developed to control ATS (Automatic Transfer Switch) units.

The main purpose of the ATS controller is to control and monitor the transfer switch as well as issuing an engine start signal to a connected genset control. The controller is continuously monitoring the presence of a source. If the preferred source fails, it attempts to transfer to a second source (emergency power supply, etc.).

It is NOT the task of an ATS controller to monitor a start/stop sequence. Start and stop failures will be displayed but have no effect on the functionality of the controller. Only switch failures or problems with connected position limit switches, which signal the actual position of the ATS (connected with utility or connected with emergency power supply, etc.) to the controller, block the ATS controller for further automatic functions.

Important Designations

- Source 1 Usually the preferred power source, e.g. utility supply (depends on application)
- Source 2 Usually the emergency power source, e.g. genset (depends on application)
- Transfer Change from one source to the other
- Blocked Transfer Switch Failure or inhibit command blocks transfer

Signal and Command Abbreviations

- S1 Signal: breaker in source 1 position
- S2 Signal: breaker in source 2 position
- S1O Signal: breaker in source 1 OPEN position
- S2O Signal: breaker in source 2 OPEN position
- C1 Command: close to source 1
- C2 Command: close to source 2
- C1O Command: open from source 1
- C2O Command: open from source 2

Monitoring Functions

Source Monitoring

- Overvoltage / undervoltage
- Overfrequency / underfrequency
- Voltage imbalance
- Rotation field monitoring

NOTE

If one of these monitoring functions is triggered, the ATS controller attempts to change to the non-preferred source.

Load Monitoring

- Overload
- Overcurrent

Switch Monitoring

- Monitoring for plausible position feedback
- Monitoring for transfer switch failure

NOTE

If one of these monitoring functions is triggered, then all automatic transfers are blocked.

Generator Monitoring

- Unintended stop
- Start failure

Battery Monitoring

- Overvoltage / undervoltage

Interface Monitoring

- Monitoring of the CANopen communication

Function Of the Inputs and Outputs

Discrete Inputs

The discrete inputs are grouped into two categories:

- ***programmable***
  The programmable discrete input has been programmed with a factory default function using the *LogicsManager*. The following text describes how these functions may be changed using the *LogicsManager*.

- ***fixed***
  The discrete input has a specific function that cannot be changed. The discrete input cannot be used in the *LogicsManager*.

NOTE

Depending on the configured transfer switch type (parameter 3424); the discrete inputs can be "*programmable*" or "*fixed*". Please refer to Table 3-7 on page 100.

Reply from ATS limit switch: Breaker in source 1 position ***fixed*** to discrete input [DI 1], terminal 10

⇨ Note: Normally closed (break) contact!

This discrete input indicates to the control that the breaker is closed to source 1 position if it is de-energized (logic "0").

Reply from ATS limit switch: Breaker in source 2 position ***fixed*** to discrete input [DI 2], terminal 11

⇨ Note: Normally closed (break) contact!

This discrete input indicates to the control that the breaker is closed to source 2 position if it is de-energized (logic "0").

Reply from ATS limit switch: Breaker in source 1 open position ***fixed*** to discrete input [DI 3], terminal 12

⇨ Note: Normally closed (break) contact!

This discrete input indicates to the control that the breaker is in source 1 open position if it is de-energized (logic "0"). This discrete input is ***programmable*** when transfer switch type is configured as standard.

Reply from ATS limit switch: Breaker in source 2 open position ***fixed*** to discrete input [DI 4], terminal 13

⇨ Note: Normally closed (break) contact!

This discrete input indicates to the control that the breaker is in source 2 open position if it is de-energized (logic "0"). This discrete input is ***programmable*** when transfer switch type is configured as standard.

Disconnect switch: Inhibit ATS ***programmable*** to discrete input [DI 5], terminal 14

⇨ Note: Normally closed (break) contact!

This discrete input indicates to the control that the disconnect switch is actuated. If this discrete input is de-energized (logic "0"), the "Inhibit ATS" function is enabled.

Control Inputs ***programmable*** to discrete inputs [DI 6] through [DI 12]

These discrete inputs may be used as control signals for functions, including priority selection, remote peak shave, inhibit transfer, etc. The control inputs can be configured freely. Please refer to Discrete Inputs on page 90.

Relay Outputs

The discrete outputs are grouped into two categories:

- ***programmable***
  The relay output is freely programmable using the *LogicsManager* (which is described in the following text).

- ***pre-defined***
  The relay output has been pre-defined (programmed) with this function using the *LogicsManager* (which is described in the following text). The function may be changed by using the *LogicsManager*.

NOTE

The relay outputs can be "*programmable*" or "*pre-defined*" for a specific function required for the configured transfer switch type (parameter 3424). Please refer to Table 3-10 on page 102.

LogicsManager **Relay {all}** ***programmable*** to relay [R2, R3, R4, R6, R7]

⇨ Note: Normally open (make) contact!

All relays not assigned with a defined function, may be configured via the *LogicsManager*.

LogicsManager **Relay {all}** ***programmable*** to relay [R5, R8, R9]

⇨ Note: Change-over contact!

All relays not assigned with a defined function, may be configured via the *LogicsManager*.

Start engine {all} ***pre-defined*** to relay [R5], terminals 20/21/22

⇨ Note: Change-over contact!

By energizing (or de-energizing, depending on the utilized contact) this relay an engine start signal will be issued to the genset control.

Command: close to source 1 position {all} ***pre-defined*** to relay [R6], terminals 3/4

⇨ Note: Normally open (make) contact!

By energizing this relay, a "close to source 1 position" command will be issued to the ATS.

Command: close to source 2 position {all} ***pre-defined*** to relay [R7], terminals 3/5

⇨ Note: Normally open (make) contact!

By energizing this relay, a "close to source 2 position" command will be issued to the ATS.

Command: open from source 1 position to neutral position{all} ***pre-defined*** to relay [R8], terminals 36/37/38

⇨ Note: Normally open (make) contact!

By energizing this relay, an "open from source 1 position to neutral position" command will be issued to the ATS.

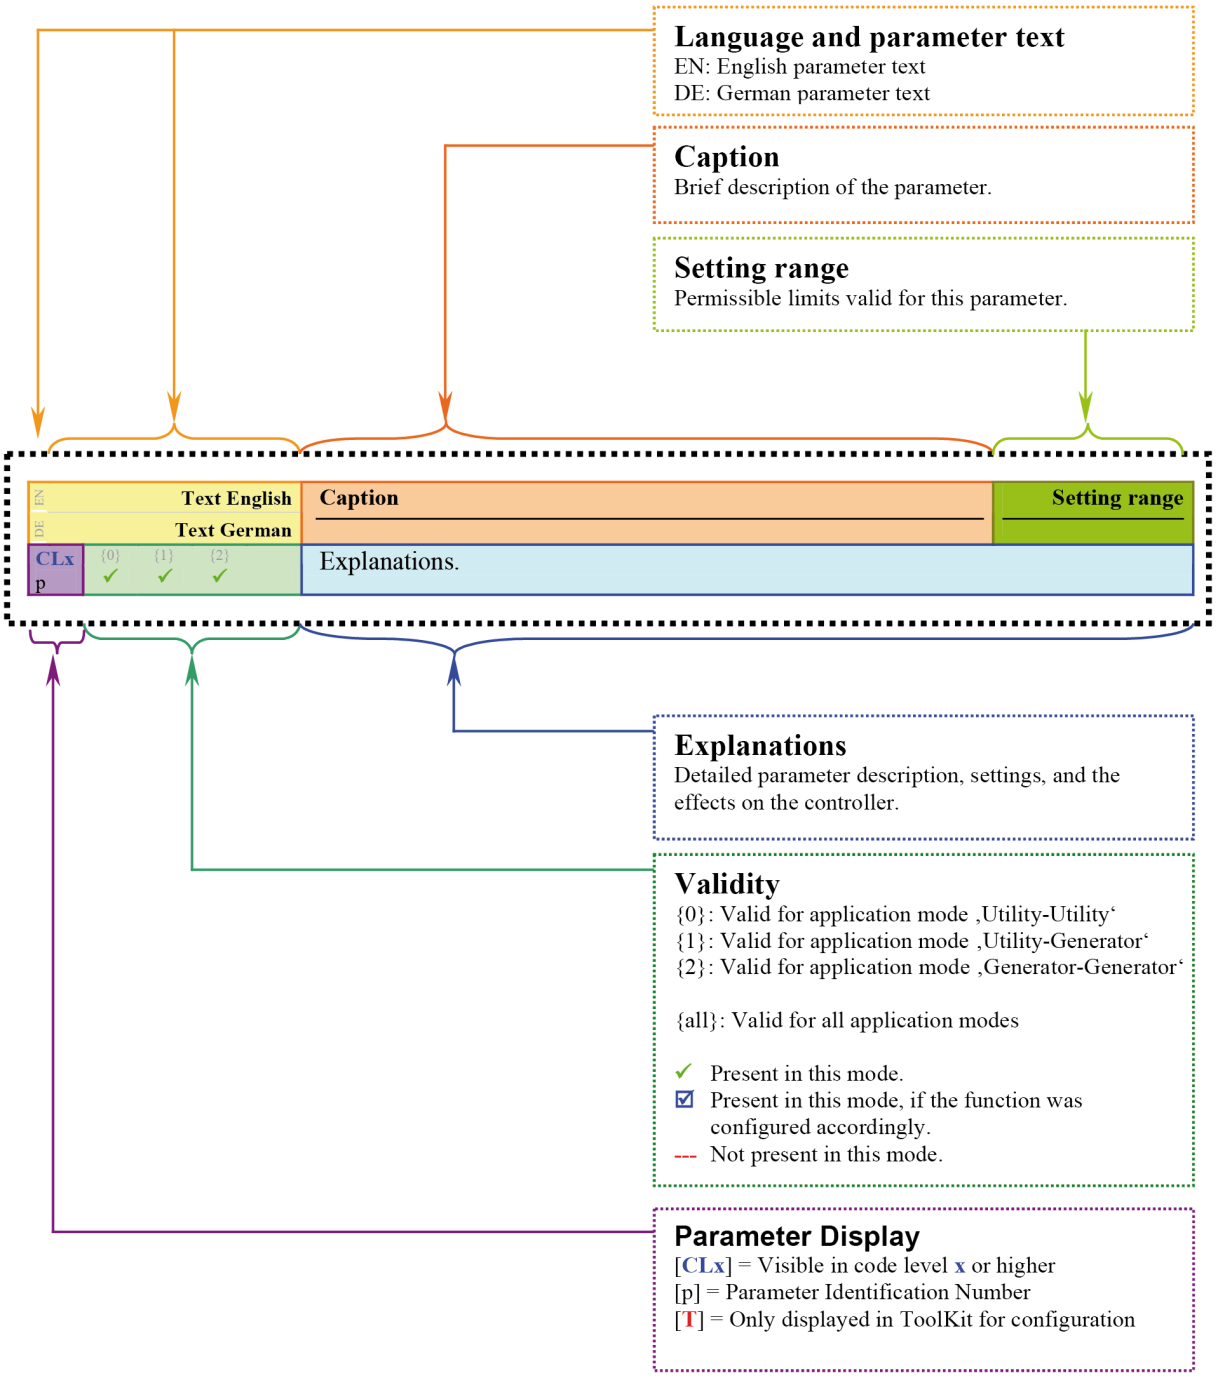
Command: open from source 2 position to neutral position{all} ***pre-defined*** to relay [R9], terminals 39/40

⇨ Note: Normally open (make) contact!

By energizing this relay, an "open from source 2 position to neutral position" command will be issued to the ATS.

Chapter 3.
Parameters

The description of the parameters is confined to the illustration via the PC-program. The parameters are described as follows.



Language

The following parameter is used to set the unit display language.

EN				Language	
DE				Language	
CL0	{0}	{1}	{2}	**Set language**	**English / Deutsch / Español / Polski / Russian / French**
1700	✓	✓	✓	The desired language for the unit display text is configured here.	

Password

The DTSC-200A utilizes a password protected multi-level configuration access hierarchy. This permits varying degrees of access to the parameters being granted by assigning unique passwords to designated personnel. A distinction is made between the access levels as follows:

Code level CL0 ***(User Level)*** Standard password = none
This code level permits for monitoring of the system and limited access to the parameters. Configuration of the control is not permitted. Only the parameters for setting the language, the date, the time, and the horn reset time are accessible. The unit powers up in this code level.

Code level CL1 ***(Basic Level)*** Standard password = "**0 0 0 1**"
This code level entitles the user to change selected non-critical parameters, such as setting the parameters accessible in CL0 plus Bar/PSI, °C/°F. The user may also change the password for level CL1. Access granted by this password expires two hours after the password has been entered and the user is returned to the CL0 level.

Code level CL2 ***(Temporary Commissioning Level)*** No standard password available
This code level grants temporary access to most of the parameters. The password is calculated from the random number generated when the password is initially accessed. It is designed to grant a user one-time access to a parameter without having to give him a reusable password. The user may also change the password for level CL1. Access granted by this password expires two hours after the password has been entered and the user is returned to the CL0 level. The password for the temp. commissioning level may be obtained from the vendor.

Code level CL3 ***(Commissioning Level)*** Standard password = "**0 0 0 3**"
This code level grants complete and total access to most of the parameters. In addition, the user may also change the passwords for levels CL1, CL2 and CL3. Access granted by this password expires two hours after the password has been entered and the user is returned to the CL0 level.

NOTE

Once the code level is entered, access to the configuration menus will be permitted for two hours or until another password is entered into the control. If a user needs to exit a code level then code level CL0 should be entered. This will block unauthorized configuration of the control. A user may return to CL0 by allowing the entered password to expire after two hours or by changing any one digit on the random number generated on the password screen and entering it into the unit.

It is possible to disable expiration of the password by entering "0000" after the CL1 or CL3 password has been entered. Access to the entered code level will remain enabled until another password is entered. Otherwise, the code level would expire when loading the standard values (default 0000) via ToolKit.

EN				Password	
DE				Passwort	
CL 0	{0}	{1}	{2}	**Password: Entry via front panel**	**0000 to 9999**
10416	✓	✓	✓	The password for configuring the control via the front panel must be entered here.	

Event History

The event history is a FIFO (First In/First Out) memory for logging alarm events and operation states of the unit. The capacity of the event history is 300 entries. As new event messages are entered into the history, the oldest messages are deleted once 300 events have occurred.
The individual alarm messages, which are stored in the event history, are described in detail in 'Appendix A: Alarm Messages' operation manual 37941. The operation states, which are stored in the event history, are listed in the table below.
The event history display is password-protected.

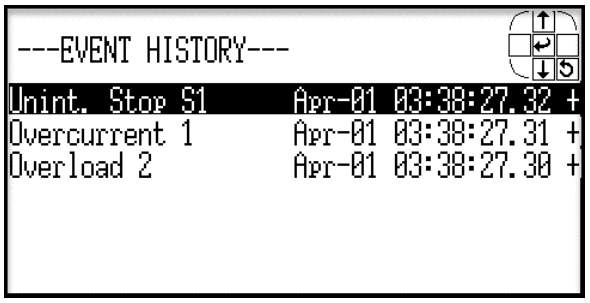


Figure 3-1: Event history- display

NOTE

The ↵ button deletes the highlighted entry!

A date/time stamp is added to each entry. Additional characters (+ and -) indicate the state of the alarm. The "+" character indicates an alarm condition that is still active. If the alarm conditions are no longer present anymore, the "+" character will be changed to "-".

EN	Event history display		
DE	Ereignisspeicher anzeigen		
CL2	{0} ✓	{1} ✓	{2} ✓

Event history: Display event history **Info**

Individual entries can be selected with the ↑ or ↓ keys and deleted from the event history with the ↵ key.

NOTE

Refer to 'Appendix A: Alarm Messages' operation manual 37941 for a complete list of all entries, which may appear in the event history.

EN	Clear event log		
DE	Ereignisspeicher löschen		
CL2 1706	{0} ✓	{1} ✓	{2} ✓

Event history: Clear event history **YES / NO**

YES .....The complete event history will be deleted. After the event history has been deleted, this parameter changes back to "NO" automatically.
NO .....The event history will not be deleted.

Measuring

NOTE

This controller is only available with 5A [../5] current transformer inputs.

NOTE

It is absolutely necessary for correct rated voltage values to be entered, as many measurement and monitoring functions refer to these values.

Measuring: Rated Values

EN Rated system frequency
DE Nennfrequenz im System
CL2 {0} {1} {2}
1750 ✓ ✓ ✓

Rated system frequency **50/60 Hz**

The rated frequency of the system is used as a reference figure for all frequency related functions, which use a percentage value, like frequency monitoring or breaker operation windows.

EN Rated voltage S1
DE Nennspannung S1
CL2 {0} {1} {2}
1774 ✓ ✓ ✓

Rated voltage source 1 **50 to 650,000 V**

ⓘ This value refers to the rated voltage of source 1 and is the voltage measured on the potential transformer primary.

The source 1 potential transformer primary voltage is entered in this parameter. The source 1 rated voltage is used as a reference figure for all source 1 voltage related functions, which use a percentage value, like utility voltage monitoring or breaker operation windows.

EN Rated voltage S2
DE Nennspannung S2
CL2 {0} {1} {2}
1772 ✓ ✓ ✓

Rated voltage source 2 **50 to 650,000 V**

ⓘ This value refers to the rated voltage of source 2 and is the voltage measured on the potential transformer primary.

The source 2 potential transformer primary voltage is entered in this parameter. The source 2 rated voltage is used as a reference figure for all source 2 voltage related functions, which use a percentage value, like utility voltage monitoring or breaker operation windows.

CL2 1860 {0} ✓ {1} ✓ {2} ✓

Measurement principle: S2 Load current **L1 L2 L3 / Phase L1 / Phase L2 / Phase L3**

ⓘ Please refer to the comments on measuring principles in the installation manual (37939).

L1 L2 L3 .....All three phases are monitored. The measurement, display and protection are adjusted according to the rules for 3-phase measurement. Monitoring refers to the following currents:
- I_{L1}, I_{L2}, I_{L3}.

Phase L{1/2/3} Only one phase is monitored. The measurement, display and protection are adjusted according to the rules for single-phase measurement. Monitoring refers to the selected phase.

Current and power from source 2 to the load are only measured, if the transfer switch is closed to source 2 position (S2).
The parameters 1860 and 1863 must be configured identical because they share one common CT set at the load connection.

NOTE

It is absolutely necessary for correct rated power and current values to be entered, as many measurement and monitoring functions refer to these values.

EN Rated active power [kW]
DE Nennwirkleistung [kW]
CL2 1752 {0} ✓ {1} ✓ {2} ✓

Rated active power **0.5 to 99,999.9 kW**

This value specifies the rated power.

EN Rated current
DE Nennstrom

Voltage transformer, source 2, secondary **50 to 480 V**

Some applications may require the use of potential transformers to facilitate measuring the source voltages. The rating of the secondary side of the potential transformer on source 2 must be entered into this parameter.
If the application does not require potential transformers (i.e. the generated voltage is 480 V or less), then the source volt. will be entered into this parameter.

Current Transformer

NOTE

This controller is only available with 5A [../5] current transformer inputs.

EN / DE	Load Current transformer / Last Stromwandler		
CL2 1821	{0} ✓	{1} ✓	{2} ✓

Current transformer, load **1 to 32,000/5 A**

The input of the current transformer ratio is necessary for the indication and control of the actual monitored value. The current transformers ratio should be selected so that at least 60% of the secondary current rating can be measured when the monitored system is at 100% of operating capacity (i.e. at 100% of system capacity a 5 A CT should output 3 A). If the current transformers are sized so that the percentage of the output is lower, the loss of resolution may cause inaccuracies in the monitoring and control functions and affect the functionality of the control.

Application

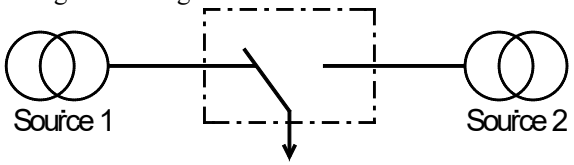
Application: Application Mode

EN / DE	Application mode / Betriebsmodus		
CL2 4148	{0} ✓	{1} ✓	{2} ✓

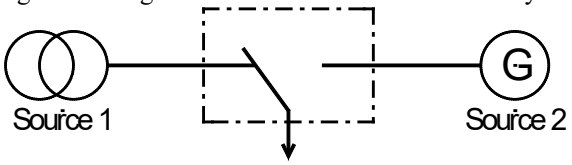
Application mode **Util-Gen / Gen-Gen / Util-Util**

This parameter selects the basic function of the unit. If the unit is used to transfer the load between two utility sources (setting "Util-Util"), no engine start signals are issued.

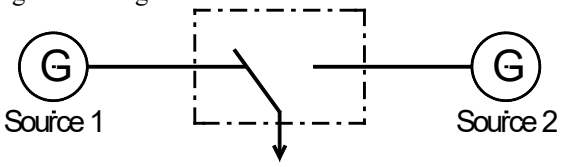
Util-Util ..... Application "utility-utility" {0}
No engine start signals will be issued.



Util-Gen..... Standard application "utility-generator" {1}
Engine start signals will be issued for source 2 only.



Gen-Gen ..... Application "generator-generator" {2}
Engine start signals will be issued for source 1 and source 2.



NOTE

In Util-Gen application, source S2 is considered as the generator.

NOTE

Refer to the application chapter of the Application manual 37942 for details.

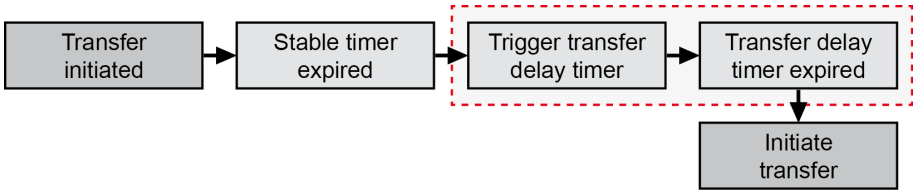
Application: Transfer Timers

Examples transfer delay:

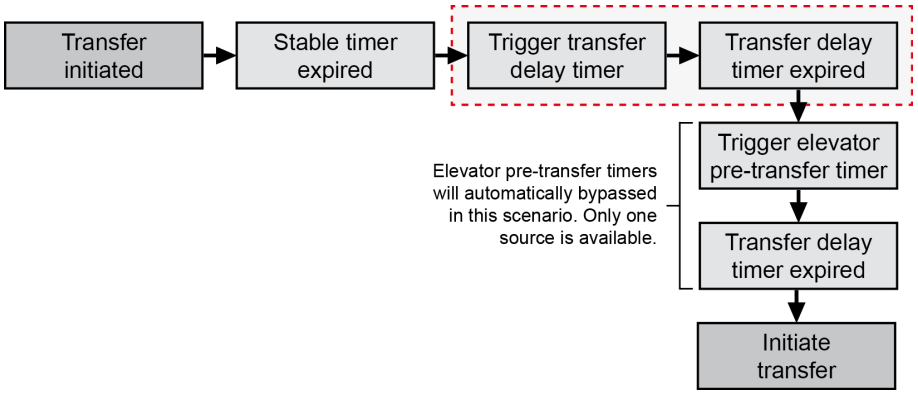
NOTE

Please refer to "Transfer delay timer S1->S2" (parameter 4496) and "Transfer delay timer S2->S1" (parameter 4497) for details.

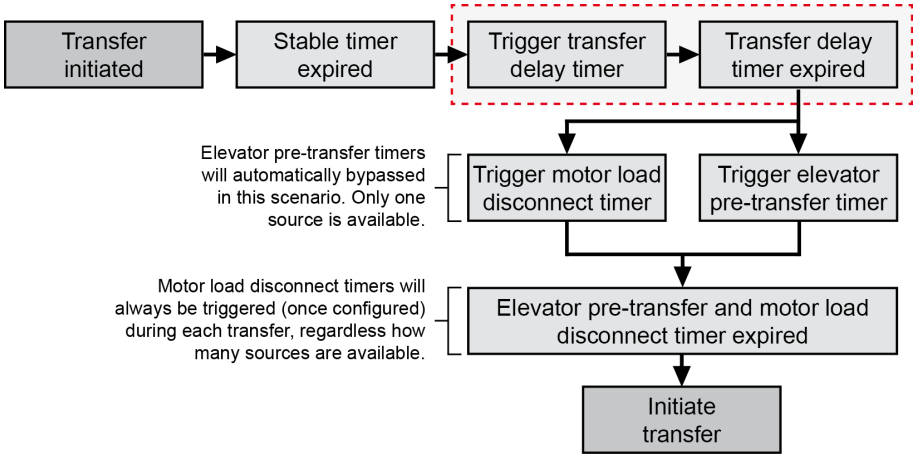
Scenario 1 ..... Transfer delay timer is configured to a value > 0 seconds
Elevator pre-transfer signal is "Disabled"
Motor load disconnect signal is "Disabled"



Scenario 2 ..... Transfer delay timer is configured to a value > 0 seconds
Elevator pre-transfer signal is "Enabled"
Motor load disconnect signal is "Disabled"



Scenario 3 ..... Transfer delay timer is configured to a value > 0 seconds
Elevator pre-transfer signal is "Enabled"
Motor load disconnect signal is "Enabled"



EN	Transfer commit		
DE	Transfer zustimmen		
CL2	{0}	{1}	{2}
4146	---	✓	---

Transfer commit **YES / NO**

This function is only effective if a transfer from the preferred source to the non-preferred source is requested.

YES..... A transfer to the non-preferred source is committed as soon as the non-preferred source stable timer has started to count. The transfer will be performed after the stable timer has expired, even if the preferred source restores. A transfer is committed even if priority source returns while the non-preferred source start timer is counting.

NO..... A transfer to the non-preferred source is only committed, if the non-preferred source stable timer has **expired completely**.
If the preferred source restores while the non-preferred source stable timer is still counting, the whole process will be aborted and the transfer switch remains on the preferred source. Even after stable timer expires, if transfer timer starts, and S1 is restored, S2 goes into cool down.

EN	Transfer delay timer S1->S2		
DE	Transfer Verzögerung S1->S2		
CL2	{0}	{1}	{2}
4496	---	---	✓

Transfer delay timer S1->S2 **0 to 6500 s**

Usually a transfer to S2 is performed as soon as the “S2 source stable time” (parameter 3332) has expired. The “Transfer delay timer S1→S2” can be used to add an additional delay to the transfer, after the “S2 source stable time” has expired.

If the “Transfer delay timer S1→S2” is configured to “0 Seconds”, it will automatically be de-activated and no longer be taken into account during transfers.

If the “Transfer delay timer S1→S2” is configured to a value > 0 Seconds, it will always be triggered after the S2 stable delay timer has expired. A bypass of the timer is possible via the “Bypass “Softkey on the display screen or via LogicsManager “Ext. bypass” (parameter 12820). Once this timer is configured to a value >0 it will always be active during each transfer. It will never be automatically bypassed.

Trigger conditions for “Transfer delay timer S1→S2”:

1. A transfer to S2 has been initiated
2. The S2 stable timer has expired
3. “Transfer delay timer S1→S2” is configured to a value larger than “0 Seconds”.

EN Transfer delay timer S2->S1
DE Transfer Verzögerung S2->S1
CL2 {0} {1} {2}
4497 --- --- ✓

Transfer delay timer S2->S1 **0 to 6500 s**

Usually a transfer to S1 is performed as soon as the “S1 source stable time” (parameter 3333) has expired. The “Transfer delay timer S2→S1” can be used to add an additional delay to the transfer, even if the “S1 source stable time” has already expired.

If the “Transfer delay timer S2→S1” is configured to “0 Seconds”, it will automatically be de-activated and no longer be taken in account during transfers.

If the “Transfer delay timer S2→S1” is configured to a value > 0 Seconds, it will always be triggered after the S1 stable delay timer has expired. A bypass of the timer is possible via the “Bypass “Softkey on the display screen or via LogicsManager “Ext. bypass” (parameter 12820). Once this timer is configured to a value >0 it will always be active during each transfer. It will never be automatically bypassed.

Trigger conditions for “Transfer delay timer S2→S1”:

1. A transfer to S1 has been initiated
2. The S1 stable timer has expired
3. “Transfer delay timer S2→S1” is configured to a value larger than “0 Seconds”.

EN S1 start delay time
DE S1 Startverzögerung
CL2 {0} {1} {2}
4149 --- --- ✓

Source 1 start delay time **0 to 300 s**

This parameter delays the energizing/de-energizing of the start relay (engine start) if source 2 is considered as "not OK" or a start, "Load Test", " No Load Test", remote peak shave or interruptible power rates request is performed.
The counter starts as soon as source 2 is considered as "not OK" or the start request is initiated.
If source 2 returns before this counter has expired, the timer will be terminated and the controller returns to standby mode (since it is not intended that the engine starts with every short temporary line fault).
If the timer has expired and source 2 has not been considered as "OK", the engine start relay will be energize/de-energize, the engine will be started, and flag 20.05 "S1 Start Signal" will be enabled.

If this timer is running, the "S1 start delay" message and the Bypass softkey are displayed.

EN S2 start delay time
DE S2 Startverzögerung
CL2 {0} {1} {2}
3330 --- ✓ ✓

Source 2 start delay time **0 to 300 s**

This parameter delays the energizing/de-energizing of the start relay (engine start) if source 1 is considered as "not OK" or a start, "Load Test", " No Load Test", remote peak shave or interruptible power rates request is performed.
The counter starts as soon as source 1 is considered as "not OK" or the start request is initiated.
If source 1 returns before this counter has expired, the timer will be terminated and the controller returns to standby mode (since it is not intended that the engine starts with every short temporary line fault).
If the timer has expired and source 1 has not been considered as "OK", the engine start relay will energize/de-energize, the engine will be started, and flag 20.06 "S2 Start Signal" will be enabled.

If this timer is running, the "S2 start delay" message and the Bypass softkey are displayed.

EN S1 Source Stable time
DE S1 Stabilisierzeit
CL2 {0} {1} {2}
3333 ✓ ✓ ✓

Source 1 source stable time **1 to 6500 s**

This parameter configures the delay before source 1 is considered as OK. This timer starts after the last monitored value has returned within the restore limits following a source 1 outage. Source 1 will be considered as OK again after this timer has expired. If the voltage and/or frequency exceeds the restore limits again before the timer expires, the timer will be reset (refer to Figure 3-2).
The source 1 stable timer is automatically bypassed if source 1 is the preferred source and the outage delay of source 2 (non-preferred) has expired.
If source 1 fails unexpectedly before this timer has expired, it will be terminated and the load will still be supplied by source 2.
This timer is intended to delay the transfer to ensure that source 1 voltage and frequency are definitely stable before the ATS switch is operated to perform a transfer to source 1.

If this timer is running, the "S1 stable timer" message and the Bypass softkey are displayed.

The S1 source stable timer is automatically bypassed, when the transfer switch is in neutral position and only S1 is available (only valid if the parameter “Transfer switch type” (parameter 3424) is configured to “Delayed” or “Closed”. This ensures the fastest possible transfer to S1 if the DTSC-200A is powered up while the system is in neutral position.

NOTE

In case a "load test" is being performed (i.e. the load is supplied by source 2, but source 1 is present as well and OK) and source 2 fails, the "S1 source stable timer" will be bypassed completely to be able to change back (OK) to source 1 immediately. This is intended to ensure that the load is not de-energized if a genset failure takes place during a load test.

EN S2 Source Stable time
DE S2 Stabilisierzeit
CL2 {0} {1} {2}
3332 ✓ ✓ ✓

Source 2 source stable time **1 to 6500 s**

This parameter configures the delay before source 2 is considered as OK. This timer starts after the last monitored value has returned within the restore limits following a source 2 outage. Source 2 will be considered as OK again after this timer has expired. If the voltage and/or frequency exceeds the restore limits again before the timer expires, the timer will be reset (refer to Figure 3-2).
The source 2 stable timer is automatically bypassed if source 2 is the preferred source and the outage delay of source 1 (non-preferred) has expired.
If source 2 fails unexpectedly before this timer has expired, it will be terminated and the load will still be supplied by source 1.
This timer is intended to delay the transfer to ensure that source 2 voltage and frequency are definitely stable before the ATS switch is operated to perform a transfer to source 2.

If this timer is running, the "S2 stable timer" message and the Bypass softkey are displayed.

The S2 source stable timer is automatically bypassed, when the transfer switch is in neutral position and only S2 is available (only valid if the parameter “Transfer switch type” (parameter 3424) is configured to “Delayed” or “Closed”. This ensures the fastest possible transfer to S2 if the DTSC-200A is powered up while the system is in neutral position.

EN S1 outage delay
DE S1 Ausfallverzögerung
CL2 {0} {1} {2}
2804 --- --- ✓

Source 1 outage delay **0.1 to 99.9 s**

This timer defines the maximum time before source 1 (voltage, frequency and phase rotation) is considered as "not OK" to initiate a transfer to source 2. This timer starts if any of the monitored source 1 values exceeds the fail limits. Source 1 will be considered as "not OK", after this timer has expired. If the voltage and/or frequency returns within the fail limits before the timer expires, the timer will be reset (refer to Figure 3-2).
This timer is intended to prevent an immediate transfer to source 2 in case of a temporary voltage or frequency drop during a load test due to a short temporary failure of source 1 (i.e. ignition miss of a genset, etc.).

If this timer has expired, the alarm "Unint. stop S1" is issued.

Note: If source 2 is the "preferred source" and the "S1 outage delay" timer has expired (i.e. source 1 is considered as "not OK"), the "S2 source stable timer" will be bypassed.

EN S2 outage delay
DE S2 Ausfallverzögerung
CL2 {0} {1} {2}
2803 --- ✓ ✓

Source 2 outage delay **0.1 to 99.9 s**

This timer defines the maximum time before source 2 (voltage, frequency and phase rotation) is considered as "not OK" to initiate a transfer to source 1. This timer starts if any of the monitored source 2 values exceeds the fail limits. Source 2 will be considered as "not OK", after this timer has expired. If the voltage and/or frequency returns within the fail limits before the timer expires, the timer will be reset (refer to Figure 3-2).
This timer is intended to prevent an immediate transfer to source 1 in case of a temporary voltage or frequency drop during a load test due to a short temporary failure of source 2 (i.e. ignition miss of a genset, etc.).

If this timer has expired, the alarm "Unint. stop S2" is issued.

Note: If source 1 is the "preferred source" and the "S2 outage delay" timer has expired (i.e. source 2 is considered as "not OK"), the "S1 source stable timer" will be bypassed.

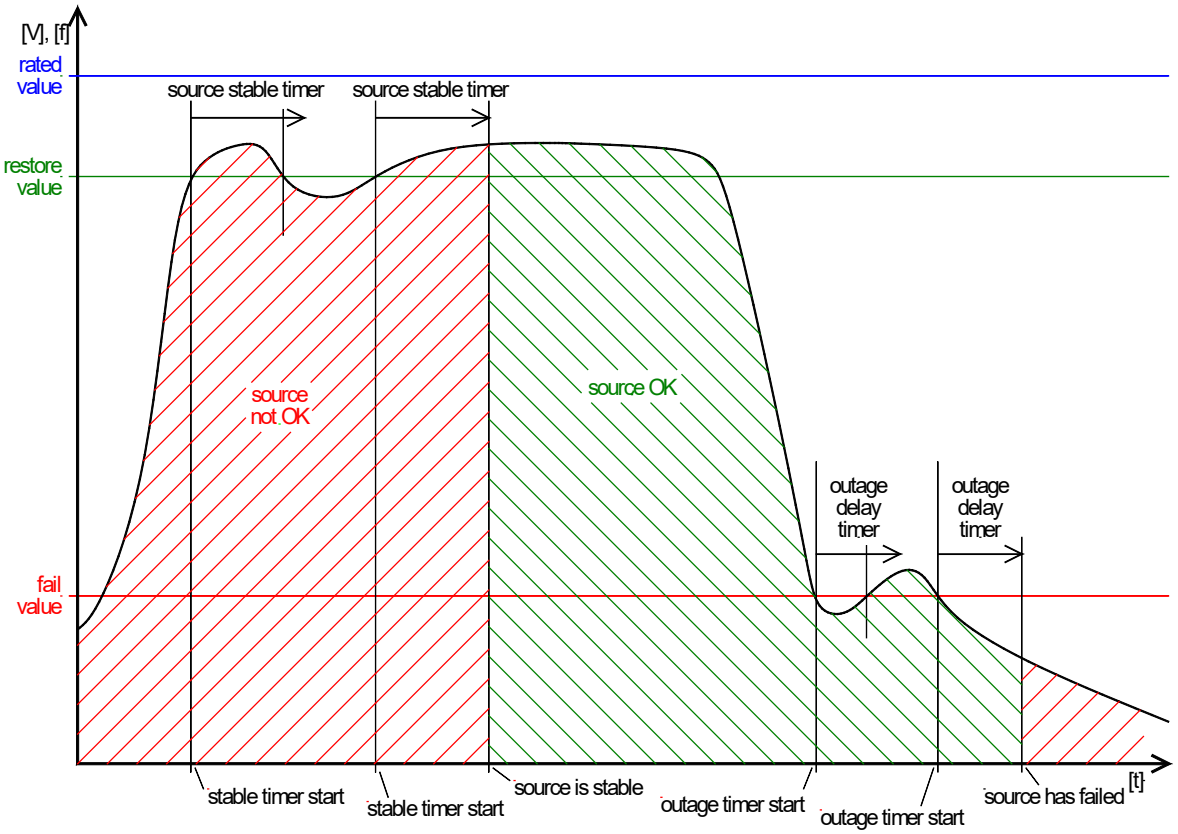


Figure 3-2: Source stable and outage timers

NOTE

Figure 3-2 describes the principle of stable and outage timers for an example where a threshold needs to be exceeded to consider the source as "OK" (like underfrequency or undervoltage).

In cases which a value needs to drop below the threshold for that source to be considered as OK (overfrequency, voltage imbalance or overvoltage), the restore value is lower than the fail value.

EN				S1 cooldown time
DE				S1 Nachlaufzeit
CL2	{0}	{1}	{2}	
3343	---	---	✓	

Engine 1 cooldown time **1 to 6500 s**

This parameter configures the duration of the cool down phase of engine 1 after the load has been disconnected.

If this timer is running, the "S1 cooldown" message and the Bypass softkey are displayed.

EN				S2 cooldown time
DE				S2 Nachlaufzeit
CL2	{0}	{1}	{2}	
3344	---	✓	✓	

Engine 2 cooldown time **1 to 6500 s**

This parameter configures the duration of the cool down phase of engine 2 after the load has been disconnected.

If this timer is running, the "S2 cooldown" message and the Bypass softkey are displayed.

EN Start S1 even if inhibited
DE Start S1 auch wenn gesperrt

	{0}	{1}	{2}
CL2 2586	---	✓	✓

Start S1 even if inhibited **Yes/No**

This parameter determines if the S1 source (usually engine) shall be started even the load transfer is inhibited.

For example it could make sense to start the engine(s) because there must be several engines started and ready for load before the transfer is executed.

EN Start S2 even if inhibited
DE Start S2 auch wenn gesperrt

	{0}	{1}	{2}
CL2 2587	---	✓	✓

Start S2 even if inhibited **Yes/No**

This parameter determines if the S2 source (usually engine) shall be started even the load transfer is inhibited.

For example it could make sense to start the engine(s) because there must be several engines started and ready for load before the transfer is executed.

Application: Transfer Logics (*LogicsManager*)

NOTE

All functions which are described in the following text may be assigned by the *LogicsManager* to any relay which is available via the *LogicsManager* and not assigned to another function. The assignment of the defined relays to defined functions occurs by selection of the application mode. The same way some relays are designated to specific functions, others may be assigned to different functions. These are listed as "programmed" relays. If a relay is "programmable" the function may be assigned to other relays by configuring the *LogicsManager*.

Inhibit ATS

If this logical output becomes TRUE, the ATS controller is blocked against automatic transfers and the "ATS Inhibit" message is displayed. Usually, a selected relay output is configured to this *LogicsManager* function, which may be used to block the ATS controller when a disconnect switch is connected to this "Inhibit ATS" relay output.
All automatic transfers will be blocked. Only the "Engine start" signal will still be issued.

EN				Inhibit ATS
DE				Blockiere ATS
CL2	{0}	{1}	{2}	
12600	✓	✓	✓	

Inhibit ATS *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

NOTE

The disconnect switch must be located in the ATS cabinet. During a manual transfer, the disconnect switch is operated to the “Inhibit ATS” position, which will block the controller from performing an automatic transfer.

WARNING

If the “Inhibit ATS” function is not active during a manual transfer, serious injury may occur!

Always inhibit automatic ATS transfers before performing a manual transfer!

Inhibit Transfer to Source 1

If this logical output becomes TRUE, the transfer back to source 1 will be blocked temporarily and the "Inhib. XFR to S1" message is displayed.

Application example:
A hospital has a source 1 (preferred source) power failure. Source 2 would then be started, and a transfer to S2 will occur, with the load being supplied by that source. When source 1 returns, a transfer back to S1 may be prevented by making Inhibit Transfer to Source 1 *LogicsManager* function TRUE (i.e. energizing a DI). In this case, a transfer back to source 1 may have some risk involved if a difficult surgery is in progress. A potential mechanical failure resulting from transfer can be avoided by using this function.

EN				Inhib. XFR to S1
DE				Trans S1 sperren
CL2 12610	{0} ✓	{1} ✓	{2} ✓	

Inhibit transfer to source 1 *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Inhibit Transfer to Source 2

If this logical output becomes TRUE, the transfer to source 2 will be blocked temporarily and the "Inhib. XFR to S2" message is displayed.

This function has the same behavior as the "Inhibit XFR to source 1" function, except that a transfer to source 2 will be prevented.

EN				Inhib. XFR to S2
DE				Trans S2 sperren
CL2 12620	{0} ✓	{1} ✓	{2} ✓	

Inhibit transfer to source 2 *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Remote Peak Shave

If this logical output becomes TRUE, the non-preferred source will be started, a transfer to the non-preferred source will be performed, and the "Rem.peak shave" message is displayed as soon as the transfer is completed. The load will then be supplied by the non-preferred source. If the logical output becomes FALSE again, a regular transfer sequence back to the preferred source will be performed including the expiry of all timers belonging to this sequence.
If the non-preferred source fails during a remote peak shave request and the preferred source is available, an immediate transfer back to the preferred source will be performed.

EN				Remote peak shave
DE				Spitzenlast Modus
CL2 12630	{0} ✓	{1} ✓	{2} ✓	

Remote peak shave *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Interruptible Power Rate Provisions

If this logical output becomes TRUE, the non-preferred source will be started, a transfer to the non-preferred source will be performed, and the "Pwr.rate.prov." message is displayed as soon as the transfer is completed. The load will then be supplied by the non-preferred source. If the logical output becomes FALSE again, a regular transfer sequence back to the preferred source will be performed including the expiry of all timers belonging to this sequence.
If the non-preferred source fails during an interruptible power rate provisions request and the preferred source is available, an immediate transfer back to the preferred source will be performed.

This function may be used in some countries where the provider offers contracts, which contain provisions for the customer to disconnect from the utility during peak load times and change to a different power supply (e.g. genset), like the United States. In case the alternative (genset) supply fails during a "Interruptible power rate provisions" request, a transfer to the preferred source will be performed with the effect that the customer must pay a reimbursement to the provider.

EN				Int. pow. rates
DE				Anforder. Netzbetr.
CL2 12660	{0} ✓	{1} ✓	{2} ✓	

Interruptible power rate provisions *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

External Timer Bypass

If this logical output becomes TRUE (by energizing a DI for example), all timers, which are in progress at the moment and can be bypassed, are bypassed. This has the same effect as pressing the "Bypass" softkey.

EN				Ext. bypass
DE				Ext. Zeit Bypass
CL2 12820	{0} ✓	{1} ✓	{2} ✓	

External timer bypass *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

NOTE

If another timer becomes active immediately after the previous timer has been bypassed, the discrete input must be de-energized before it may be energized again to bypass the next timer. We recommend using a momentary push-to-make button for this function.

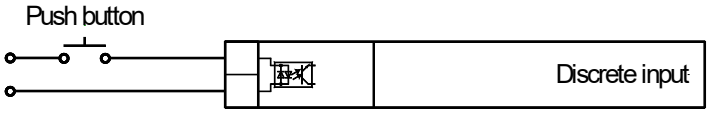

Figure 3-3: External timer bypass - push button

Gen-Gen Enable

This function is only enabled if the application mode (parameter 4148) is configured to "Gen-Gen". If this logical output becomes TRUE (by energizing a DI for example), the gen-gen mode will be enabled.

The behavior of the function depends on the source priority:

- Only the *LogicsManager* function "Source priority S1" (parameter 12680) is TRUE:
  The source 1 genset will be started. If source 1 doesn't start or fails, source 2 genset will be started automatically.

- Only the *LogicsManager* function "Source priority S2" (parameter 12810) is TRUE:
  The source 2 genset will be started. If source 2 doesn't start or fails, source 1 genset will be started automatically.

- Both source priority *LogicsManager* functions (parameters 12680 and 12810) are TRUE or both are FALSE:
  Source 1 has priority, i.e. the source 1 genset will be started. If source 1 doesn't start, source 2 genset will be started automatically.

If the gen-gen mode will be disabled again, all start requests are terminated and the genset, which is currently in operation, will be shut down with a cool down.

EN	Gen-Gen enable		
DE	Gen-Gen Aktivieren		
CL2	{0}	{1}	{2}
12830	---	---	✓

Generator-Generator mode enable *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Application: Elevator Pre-Signal

The elevator pre-signal flag (20.01) may be assigned to any output relay using the *LogicsManager*.

The elevator pre-signal is important for buildings which are equipped with elevators. This signal will be enabled before any transfer in order to signal a transfer to an elevator control. If this signal is received by an elevator control, the elevator stops at the next floor and opens the doors. This signal is enabled until the transfer is completed. Then, the signal will be disabled and the elevator is able to operate regularly again.

This function may be used if there is a load test performed during regular hospital operation. A load test means that two sources are available. This signal will not be set in case of a utility failure. In this case, the elevator might get stuck between two floors and it makes no sense to enable the elevator pre-signal. Possibly stuck elevators are accepted and the main target is to attempt to supply the load. As soon as the supply returns, the elevators are ready to operate again.

NOTE

The elevator pre signal (EPS) may be enabled in parallel with a motor load disconnect signal (MLD) if a MLD signal is configured. EPS and MLD are two functions, which operate completely independent and don't affect each other.

If the EPS timer will be bypassed, the MLD signal will be processed consequently (if configured). Otherwise, the transfer sequence will be continued. If the transfer has been performed, the EPS signal will be reset. This is also valid, if the EPS signal has been bypassed prior to the transfer and a MLD timer was configured additionally.

This timer is automatically bypassed, if not both sources are available (and stable) for transfer.

If, for example, a load test has been requested and cancelled again while the EPS signal is active, the EPS relay will be reset automatically and the complete process will be terminated.

EN	Elevator Pre Signal

DE	Warnsignal Dauer		
CL2	{0}	{1}	{2}
4491	✓	✓	✓

Elevator pre-signal duration — **1 to 6500 s**

The time configured here determines how long the elevator pre-signal is enabled before the transfer process will be continued. The signal will be disabled again if the transfer process has been completed.
If this timer is running, the "Pre signal timer" message is displayed.

The following examples show the behavior of the elevator pre-signal for different applications.

Example 1 (elevator pre-signal disabled):

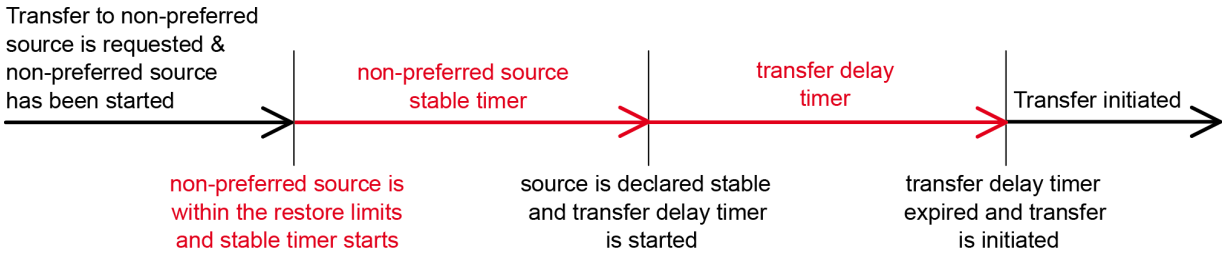

Figure 3-4: Elevator pre-signal - example 1

Example 2 (elevator pre-signal enabled):

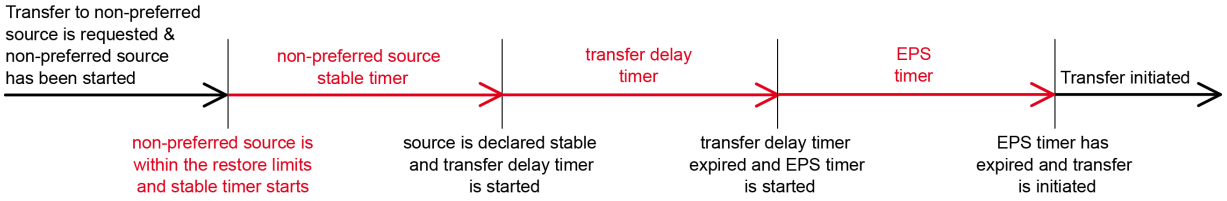

Figure 3-5: Elevator pre-signal - example 2

Example 3 (elevator pre-signal and motor load disconnect enabled):

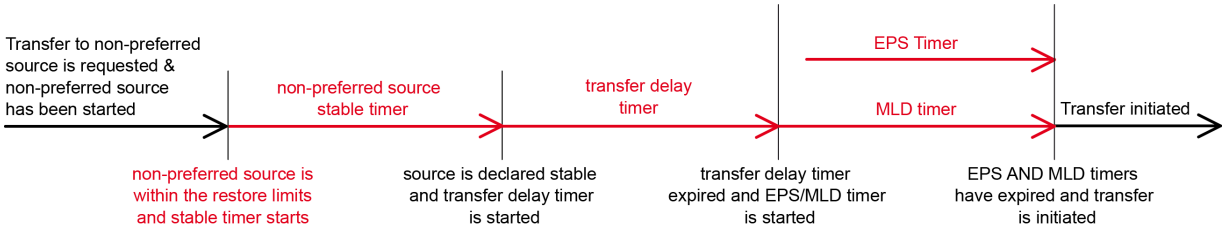

Figure 3-6: Elevator pre-signal - example 3

NOTE

If the transfer delay timers are configured to "0" seconds, they will automatically be bypassed and no longer taken in account during a transfer.

Application: Motor Load Disconnect

The motor load disconnect flag (20.02) may be assigned to any output relay using the *LogicsManager*.

The motor load disconnect function is intended for sequential load shedding before a transfer and sequential load addition after a transfer. This shall prevent the addition of the complete load at once.
The loads will be disconnected one after the other before a transfer. Then, the loads will be connected again in the same order following the transfer.

In contrast to the elevator pre-signal, this signal will also be enabled in case of a preferred source failure. No automatic or manual bypass of this signal will be performed.

EN Motor Load Disconnect
DE Lastabwurf
CL2 4550 {0} ✓ {1} ✓ {2} ✓

Motor load disconnect **ON / OFF**

OFF.....No motor load disconnect signal is issued, no motor load disconnect signal timer starts and the *LogicsManager* flag 20.02 is not enabled. It will be proceeded with the operation of the transfer switch.
ON.....The motor load disconnect signal will be issued before any transfer and the *LogicsManager* flag 20.02 will be enabled. The remaining motor load disconnect signal time is displayed with the "Motor Load Disc." message. After the motor load disconnect timer expires, the transfer switch will be operated. The signal will be disabled again if the transfer process has been completed.

Skip load disconnect **Yes/No**

This parameter determines whether the motor load disconnect timer shall be bypassed if the prioritized source has an outage.

EN Bypass MLD possible
DE Erlaube Bypass MLD
CL2 2590 {0} ✓ {1} ✓ {2} ✓

Bypass MLD possible **Yes/No**

This parameter determines whether the bypassing of the motor load disconnect timer is allowed.
With “Yes” the motor load disconnect timer can be bypassed by display operation or by LM 12820 “Ext. bypass” be bypassed.
With “No” the motor load disconnect timer can neither be bypassed over display nor by LM 12820 “Ext. bypass”.

Application: Source Priority Selection

The two *LogicsManager* functions "Source Priority S1" and "Source Priority S2" are used to determine which source is to be considered as preferred. The *LogicsManager* enables to use a discrete input (for example) to select the preferred source externally using a source priority selector switch, which is usually on the operation panel.

In general, the preferred source is the one, which is permanently available. The NON-preferred source serves as second source, which will be enabled if the preferred source fails or if a remote start signal is present.

Application examples:

- One utility supply, one generator (Util-Gen application)
  If the utility (source 1) is defined as preferred source, the genset (source 2) will be started if the utility fails. If the genset is defined as preferred source, the engine start signal is permanently enabled until the source priority changes to the other source.

NOTE

Changing the priority while a load test (parameter 12640), remote peak shave (parameter 12630) or interruptible power rates (parameter 12660) operation is enabled, results in a transfer to the selected non-preferred source.

- Two utility supply networks (Util-Util application)
  In this case, the customer might select one utility supply as preferred source. In case of a failure of the preferred source, the load will be transferred to the other source.

- Two generators (Gen-Gen application)
  In this case, the customer might select one generator as preferred source. In case of a failure of the preferred source, the other genset will be started and the load will be transferred to the other source.

If the *LogicsManager* function "Source Priority S1" becomes TRUE, source 1 will be considered as preferred.

EN S1 Priority
DE S1 Priorität
CL2 12680 {0} ✓ {1} ✓ {2} ✓

Source Priority S1 ***LogicsManager***

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

If the *LogicsManager* function "Source Priority S2" becomes TRUE, source 2 will be considered as preferred.

EN S2 Priority
DE S2 Priorität

Source Priority S2 ***LogicsManager***

CL2 12810	{0} ✓	{1} ✓	{2} ✓	The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

NOTE

If no source is preferred (both *LogicsManager* functions are FALSE or both *LogicsManager* functions are TRUE), source 1 will be the preferred source.

Application example 1 (source priority = S1):

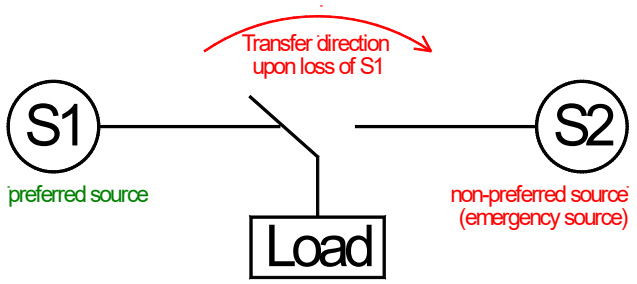

Figure 3-7: Source priority selection - S1 preferred

Application example 2 (source priority = S2):

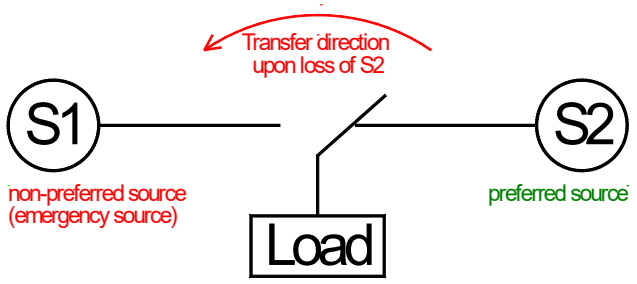

Figure 3-8: Source priority selection - S2 preferred

If the preferred source is available, the load will automatically be connected to the preferred source (except when a transfer to the non-preferred source is forced by a load test or remote peak shave, etc.).

It is also possible to change the source priority while the load is connected to the preferred or non-preferred source.

If the load is connected to the non-preferred source and this non-preferred source is chosen as the preferred source, the load remains connected to this source.
If the load is connected to the preferred source and this preferred source is chosen as the non-preferred source, the load will be transferred to the "new" preferred source.

Extended Parallel Time

NOTE

This function is only effective if the transfer switch type (parameter 3424) is configured to "Closed" and in-phase monitoring (parameter 4570) is enabled.

If a closed transition is performed, the overlap time of the make-before-break process, in which both sources are parallel, is as configured in parameter 4577 (Max. overlap time). If this time is to be extended, a *LogicsManager* function is available to keep the transition switch in overlap position. This may be achieved by a digital signal of an external synchronization device for example.

If transfer switch type (parameter 3424) is configured as “Standard”, external sync. permission (ext. permit for closed transition (parameter 4584) and closed transfer enable (parameter 4584)) does not apply.

If the *LogicsManager* function "Ext. para. time" becomes TRUE, the transfer switch will remain in overlap position. If it becomes FALSE again, the source, from which the transfer has been initiated, will be disconnected and the load will be supplied by the new source.

EN	Ext. para. time		
DE	Erweiterte para. Zeit		
CL2	{0}	{1}	{2}
12860	✓	✓	✓

Extended parallel time ***LogicsManager***

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

NOTE

As long as this function is TRUE, parameter 4577 (Max. overlap time) is not effective.

NOTE

If one source fails as long as this function is TRUE, the failed source will automatically be disconnected.

WARNING

Both sources remain in overlap position as long as this function is TRUE.

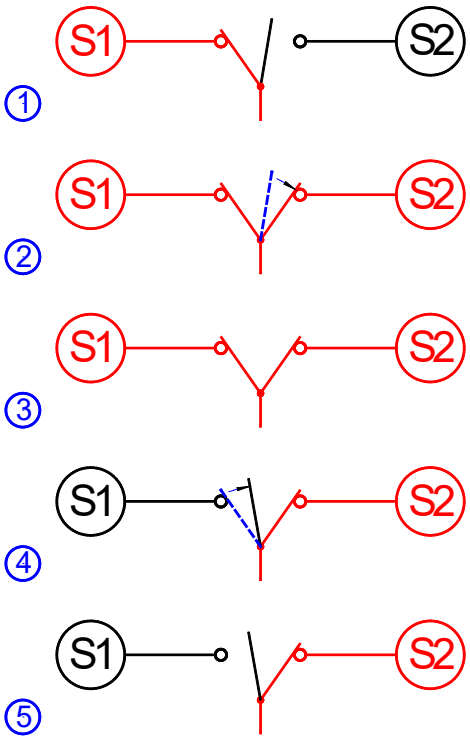
Both sources are not decoupled if

- **a load test (parameter 12640 on page 65) is disabled**
- **a remote peak shave request (parameter 12630 on page 40) is disabled**
- **an interruptible power rate request (parameter 12660 on page 41) is disabled**
- **the priority is changed**

An overlap situation is only decoupled if

- **the "Extended parallel time" function becomes FALSE again**
- **the phase angle during overlap position is > 2.0° or < -2.0°**

The following example shows a typical transfer sequence from source 1 to source 2 with extended parallel time:



Initial situation:
Load is supplied by source 1

A transfer is initiated (e.g. by a load test):
As soon as source 2 is detected as stable and synchronicity is achieved, the transfer switch is closed to source 2.

Extended parallel time is active:
As long as the *LogicsManager* function is TRUE, the transfer switch remains in overlap position and load is supplied by both sources.

Extended parallel time expires:
As soon as the *LogicsManager* function becomes FALSE, the transfer switch opens from source 1.

Final situation:
Load is supplied by source 2

Load Shed

NOTE

Load shed is inactive as long as an "Extended parallel time" (parameter 12860) is enabled.

The load shed function bypasses the in-phase monitoring function. This can cause an asynchronous transfer in case a standard transition switch is used.

The load shed function is intended to shed the load from the non-preferred source if a load shed signal is received from a master controller (e.g. SCADA system) via a discrete input.

If a load shed signal is received from a master control, the DTSC disconnects the load from the non-preferred source immediately. The following rules are valid for the load shed function:

- The load must be supplied by the non-preferred source. The load shed function can only trigger to disconnect the load from the non-preferred source. If the load is supplied by the preferred source while a load shed signal is triggered, the load will not be disconnected.
- Possible timers for pre-transfer signals like motor load disconnect or elevator pre-signal, which are enabled prior to the transfer, will be ignored in case of a load shed request.
- If in-phase monitoring is enabled, this will be ignored in case of a load shed request.
- If the *LogicsManager* function "Inhibit XFR to S1" or "Inhibit XFR to S2" is TRUE and would prevent a transfer to the preferred source, this function will be ignored on case of a standard transition switch. If a delayed or closed transition switch is used, the switch will open to neutral position.
- If transfer switches are used, which may only be operated in case a measuring voltage is present, a transfer to the preferred source may only be possible, when it is present. If only the non-preferred source is present, the *LogicsManager* flag "Load shed" (20.11) will be enabled. This flag enables to close a load shed relay, which connects the voltage of the non-preferred source to the preferred source side of the transfer switch to operate it. If the neutral position (delayed / closed switch) or the preferred source position (standard switch) is detected by the DTSC, the load shed signal will be reset again. Refer to Figure 3-9 and Figure 3-10 for more detailed information.

If the *LogicsManager* function "Load shed" becomes TRUE, a load shed from the non-preferred source will be performed.

EN	Load shed		
DE	Nicht prio. LS auf		
CL2 12870	{0} ✓	{1} ✓	{2} ✓

Load shedding enabled ***LogicsManager***

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Table 3-1 defines the behavior in case of a load shed request when utilizing a standard transition switch depending on the system conditions.

Load is connected to	Pre-transfer signals	In-phase monitoring	Preferred source available	Behavior on load shed request
Non-preferred source	Bypassed	Bypassed	Yes	Immediate transfer to preferred source
Non-preferred source	Bypassed	Bypassed	No	*LogicsManager* flag "Load shed" (20.11) is set to transfer to the preferred source
Preferred source	N/A	N/A	Yes	No action performed - load remains connected to preferred source

Table 3-1: Application - load shed with standard transition switch

Table 3-2 defines the behavior in case of a load shed request when utilizing a delayed or closed transition switch depending on the system conditions.

Load is connected to	Pre-transfer signals	In-phase monitoring	Preferred source available	Behavior on load shed request
Non-preferred source	Bypassed	Bypassed	Yes	Immediate transfer to preferred source
Non-preferred source	Bypassed	Bypassed	No	*LogicsManager* flag "Load shed" (20.11) is immediately set to open to neutral position If the preferred source restores while the switch is in neutral position, a transfer to the preferred source is initiated without waiting for the preferred source stable timer to expire
Preferred source	N/A	N/A	Yes	No action performed - load remains connected to preferred source

Table 3-2: Application - load shed with delayed or closed transition switch

Figure 3-9 shows how to wire a load shed relay for applications, which use a standard transition switch (S1 is the preferred source and S2 is the non-preferred source with this application).

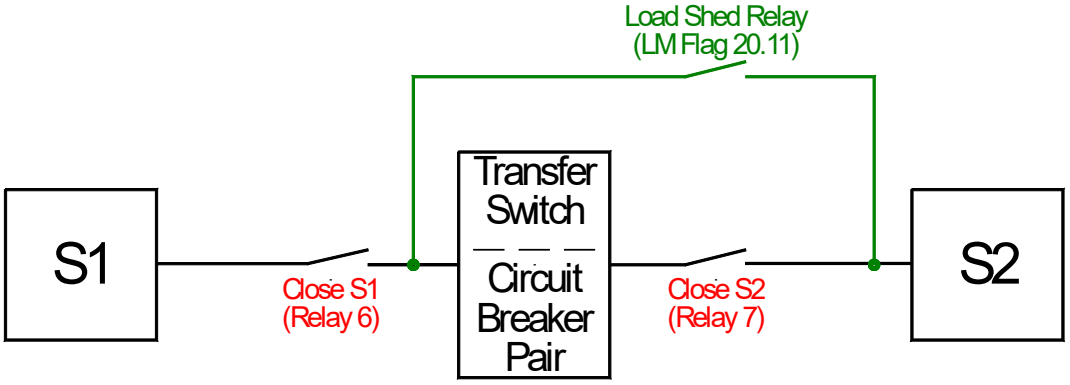


Figure 3-9: Load shed relay wiring - standard transition switch

Figure 3-10 shows how to wire a load shed relay for applications, which use a delayed or closed transition switch (S1 is the preferred source and S2 is the non-preferred source with this application).

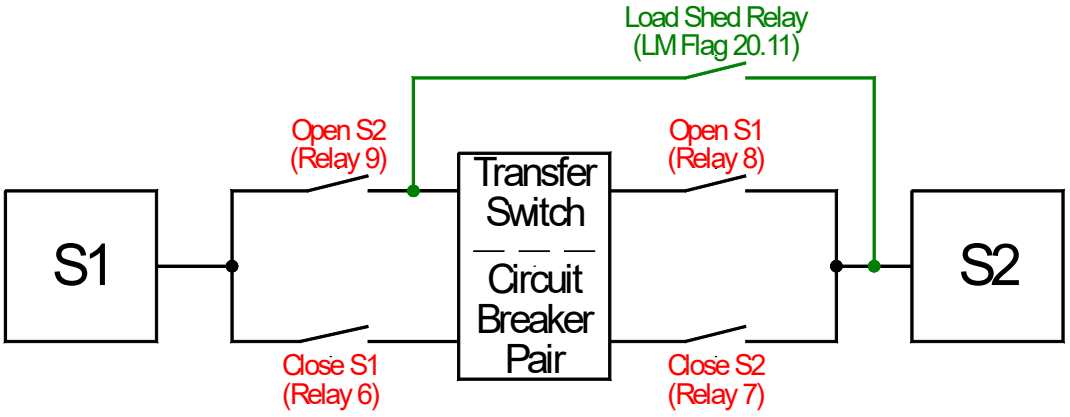

Figure 3-10: Load shed relay wiring - delayed or closed transition switch

NOTE

The load shed relay must always be operated at the non-preferred source side with the power of the non-preferred source.

If a load shed relay is used, preferred and non-preferred source priority must not be changed since this would lead to a malfunction of the load shed function.

Service Disconnect

NOTE

Service disconnect is only active, if the "Transfer switch type" (parameter 3424) is configured to "Delayed" or "Closed". The transfer switch type "Standard" does not support this feature.

This feature allows disconnecting the load from the source in case of a service operation.

If the *LogicsManager* function "Service Disconnect" becomes TRUE, the transfer switch opens to neutral position and remains there until this function becomes FALSE again.

No automatic transfers to any source will be performed if the transfer switch has reached neutral position and this *LogicsManager* function is enabled.

If the transfer switch is in neutral position and this *LogicsManager* function becomes FALSE again, the unit changes to the "preferred source" (if available) automatically. If the "preferred source" is not available, it changes to the "non-preferred source" automatically.

Breaker

Breaker: Transfer Switch Type

EN	Transfer switch type		
DE	Transfer Schalter Typ		
CL2	{0}	{1}	{2}
3424	✓	✓	✓

Transfer switch type **Standard / Delayed / Closed**

This parameter configures the type of ATS switch, which is connected to the controller. The switch logic behavior depends on the setting configured here.
Standard..... An "open transition" switch is selected.
Delayed..... A "delayed transition" switch is selected.
Closed..... A "closed transition" switch is selected.

Standard Transfer Switch

If an open transition switch is used, "Standard" transfer switch type must be selected.
This switch type may only take on two states:

NOTE

Do not use “Standard” switch mode with breaker type transfer switches. Open commands are not used! “Standard” mode is used with mechanically interlocked transfer type mechanisms only!

- Position 1: Connected to source 1

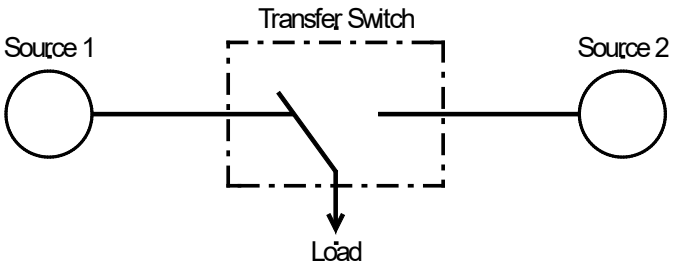

Figure 3-11: Open transition switch - connected to source 1

- Position 2: Connected to source 2

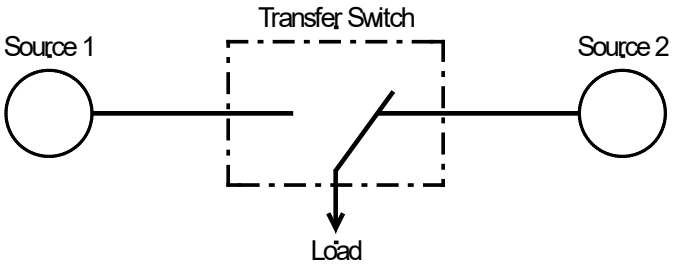

Figure 3-12: Open transition switch - connected to source 2

The following switch commands are enabled in this mode:
- *LogicsManager* flag (20.07) : Command: Close to Source 1
- *LogicsManager* flag (20.09) : Command: Close to Source 2

These signals may be configured to relay outputs to operate the ATS switch mechanics.

The following feedback signals are evaluated by the ATS controller for monitoring the actual switch position:
- Discrete input 1 (ATS breaker in Source 1 position) = signal designation: S1
- Discrete input 2 (ATS breaker in Source 2 position) = signal designation: S2

In this mode Use Limit Switch Open Replies (3434) is disabled (setting “NO”).

The following additional features are recommended for this mode:
- In-phase monitor (refer to the In-Phase Monitor section)
- Motor load disconnect

Delayed Transfer Switch

If a delayed transition switch is used, "Delayed" transfer switch type must be selected.
This switch type may take on three states:

- Position 1: Connected to source 1

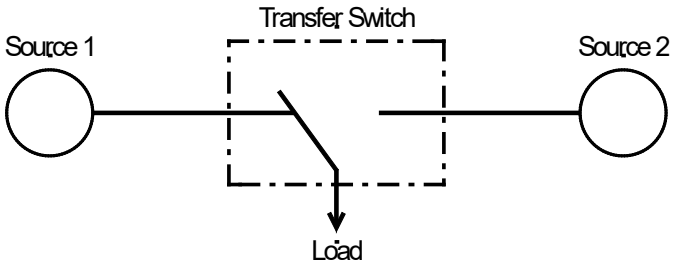

Figure 3-13: Delayed transition switch - connected to source 1

- Position 2: Neutral

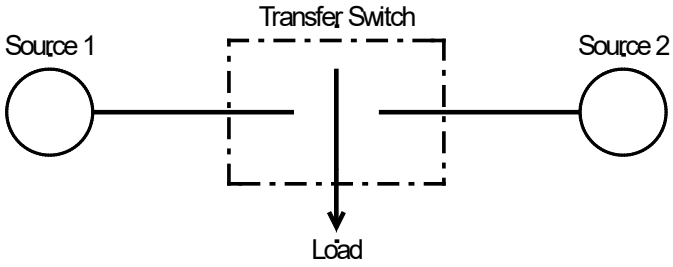

Figure 3-14: Delayed transition switch - neutral position

- Position 3: Connected to source 2

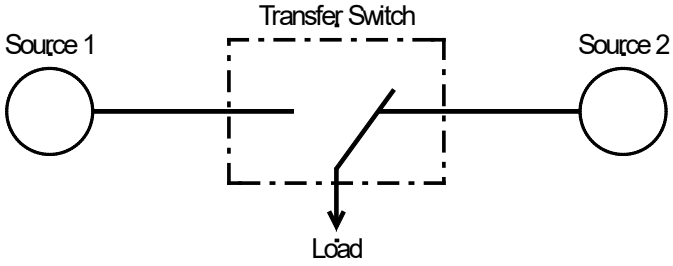

Figure 3-15: Delayed transition switch - connected to source 2

The following switch commands are enabled in this mode:
- *LogicsManager* flag (20.07) : Command: Close to Source 1
- *LogicsManager* flag (20.08) : Command: Open Source 1
- *LogicsManager* flag (20.09) : Command: Close to Source 2
- *LogicsManager* flag (20.10) : Command: Open Source 2

These signals may be configured to relay outputs to operate the ATS switch mechanics.

The following feedback signals are evaluated by the ATS controller for monitoring the actual switch position if Use Limit Switch Open Replies (3434) is “YES”:
- Discrete input 1 (ATS breaker in Source 1 position) = signal designation: S1
- Discrete input 2 (ATS breaker in Source 2 position) = signal designation: S2
- Discrete input 3 (ATS breaker in Source 1 OPEN position) = signal designation: S1O
- Discrete input 4 (ATS breaker in Source 2 OPEN position) = signal designation: S2O

If Use Limit Switch Open Replies (3434) is “NO” the evaluated feedback signals are reduces to S1 and S2.

The following additional features are recommended for this mode:
- In-phase monitor (refer to the In-Phase Monitor section)
- Motor load disconnect

Closed Transfer Switch

If a closed transition switch is used, "Closed" transfer switch type must be selected.
This switch type may take on four states:

- Position 1: Connected to source 1

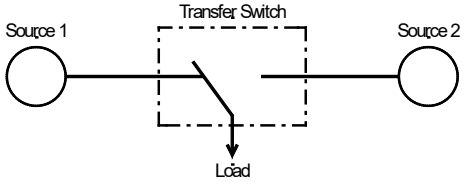

Figure 3-16: Closed transition switch - connected to source 1

- Position 2: Neutral

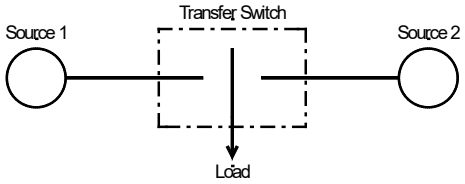

Figure 3-17: Closed transition switch - neutral position

- Position 3: Synchronized

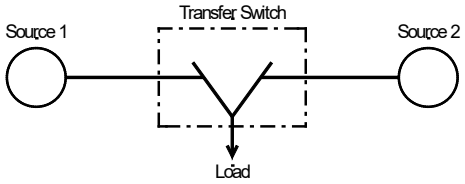

Figure 3-18: Closed transition switch - connected to source 1 and 2 (overlap position)

- Position 4: Connected to source 2

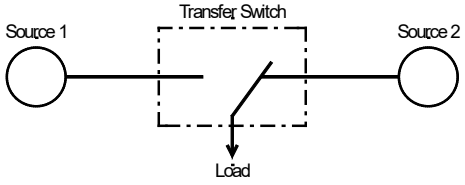

Figure 3-19: Closed transition switch - connected to source 2

The following switch commands are enabled in this mode:
- *LogicsManager* flag (20.07) : Command: Close to Source 1
- *LogicsManager* flag (20.08) : Command: Open Source 1
- *LogicsManager* flag (20.09) : Command: Close to Source 2
- *LogicsManager* flag (20.10) : Command: Open Source 2

These signals may be configured to relay outputs to operate the ATS switch mechanics.

The following feedback signals are evaluated by the ATS controller for monitoring the actual switch position if Use Limit Switch Open Replies (3434) is “YES”:

- Discrete input 1 (ATS breaker in Source 1 position) = signal designation: S1
- Discrete input 2 (ATS breaker in Source 2 position) = signal designation: S2
- Discrete input 3 (ATS breaker in Source 1 OPEN position) = signal designation: S1O
- Discrete input 4 (ATS breaker in Source 2 OPEN position) = signal designation: S2O

If Use Limit Switch Open Replies (3434) is “NO” the evaluated feedback signals are reduces to S1 and S2.

The following additional features are recommended for this mode:

- In-phase monitor must be used (refer to the In-Phase Monitor section)
- Motor load disconnect

Use Limit Switch Open Replies

This function is used to define the limit switch reply signals, which are evaluated for determining the current ATS switch position.

The following four signals are available for determining the ATS switch position:
- Discrete input 1 (ATS breaker in Source 1 position) = signal designation: S1
- Discrete input 2 (ATS breaker in Source 2 position) = signal designation: S2
- Discrete input 3 (ATS breaker in Source 1 OPEN position) = signal designation: S1O
- Discrete input 4 (ATS breaker in Source 2 OPEN position) = signal designation: S2O

NOTE

All reply signals, which are selected for determining the current ATS switch position must be connected to the discrete inputs of the DTSC to ensure a correct evaluation of the switch replies.

These discrete inputs have an N.C. logic, i.e. the breaker is considered as "in position" if the respective DI is de-energized.

EN	Use Limit sw. OPEN replies		
DE	Schalter RM OFFEN verwenden		
CL2 3434	{0} ✓	{1} ✓	{2} ✓

Use limit switch open replies **YES / NO**

This parameter may only be enabled (setting "YES") if parameter 3424 on page 55 is configured to "Delayed" or "Closed".

This parameter defines whether the limit switch open signals are also used to determine the ATS switch position.

YES..... The signals S1, S2, S1O, and S2O are used to determine the ATS switch position.
This setting provides a higher system safety because the "Switch Open" replies are also evaluated besides the "Switch Closed" replies.

NO ..... Only the signals S1 and S2 are used to determine the ATS switch position.
This setting does not use the DIs 3 and 4 for determining the ATS switch position and makes them available for other functions.

Delayed Mode Active

This function is only effective if parameter 3424 (Transfer switch type) is configured to "Closed". If the *LogicsManager* function "Delayed mode act." becomes TRUE, the transfer switch type will be set to "Delayed" until function becomes false.

EN	Delayed mode act.		
DE	Verzög. modus akt.		
CL2 12850	{0} ✓	{1} ✓	{2} ✓

Enable delayed mode ***LogicsManager***

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Transition Timers

The "Neutral Time S2 -> S1" parameter is only enabled, if "Delayed" or "Closed" is configured as "Transfer switch type" (parameter 3424).

EN Neutral Time S2->S1
DE Neutral Verweilzeit S2->S1
CL2 {0} {1} {2}
3426 ✓ ✓ ✓

Neutral Time S2 -> S1 **1 to 6500 s**

This parameter configures the residence time in neutral position when transferring the load in this transfer direction.
After this timer has expired, the transfer to source 1 will be performed.

If this timer is running, the "Neutral S1 -> S2" message is displayed.

The "Neutral Time S2 <- S1" parameter is only enabled, if "Delayed" or "Closed" is configured as "Transfer switch type" (parameter 3424).

EN Neutral Time S1->S2
DE Neutral Verweilzeit S1->S2
CL2 {0} {1} {2}
3425 ✓ ✓ ✓

Neutral Time S1 -> S2 **1 to 6500 s**

This parameter configures the residence time in neutral position when transferring the load in this transfer direction.
After this timer has expired, the transfer to source 2 will be performed.

If this timer is running, the "Neutral S1 <- S2" message is displayed.

EN Limit switch reply timeout
DE Zeitüberschreitung Rückmeld.
CL2 {0} {1} {2}
3428 ✓ ✓ ✓

Limit switch reply timeout **0.1 to 99.9 s**

This parameter configures the maximum waiting time for a feedback signal from the ATS switch. If no reply is detected within the configured time, a new transition attempt will be performed after the "Wait time until next XFR attempt" (parameter 3429) has expired (refer to Figure 3-20 on page 61). If the "Max. of transfer attempts" (parameter 3427) is exceeded, a switch failure will be issued.

If this timer is running, the Bypass softkey is not displayed. The display message while the timer is running indicates that a reply is expected and depends on the command issued:

- If source 1 is to be opened : "Wait S1 open"
- If source 2 is to be opened : "Wait S2 open"
- If source 1 is to be closed : "Wait S1 close"
- If source 2 is to be closed : "Wait S2 close"

Note: The operator coils may be damaged if this timer is configured too long (i.e. the maximum time, for which the transition pulse may be enabled, must not be exceeded).

NOTE

The limit switch reply timeout monitoring is only enabled if a transfer command (C2, C1, C2O, or C1O) has been issued from the ATS controller.

EN Wait time until next XFR attempt
DE Wartezeit vor neuem Transfer
CL2 3429 {0} ✓ {1} ✓ {2} ✓

Wait time until next transfer attempt **0.1 to 99.9 s**

This parameter configures the interval between an unsuccessful transfer attempt and the next transfer attempt.
This time allows the relay coil to cool down between the open/close signals.

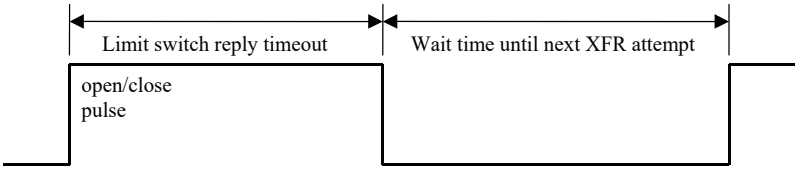

Figure 3-20: Breaker - transition pulse

EN Max. no. of transfer attempts
DE Max. Anzahl Fehlzuschaltungen
CL2 3427 {0} ✓ {1} ✓ {2} ✓

Maximum number of unsuccessful transfer attempts **0 to 10**

This parameter configures the maximum number of unsuccessful transfer attempts before a switch failure will be issued. The counter for the number of unsuccessful transition attempts will be increased with the start of each waiting time period (parameter 3429)

Note: If this parameter is configured to "0", the DTSC-200A will issue infinite transfer attempts, in case the corresponding switch reply signal is not being recognized. No "Open failure" or "Close failure" alarm will be issued.

EN Force Finalize parallel
DE Immer Parallel beenden
CL2 2589 {0} ✓ {1} ✓ {2} ✓

Force Finalize parallel **YES / NO**

In closed transition mode <100ms (see ID4577 Max. overlap time) this configuration becomes valid.

NO ..... In the moment being parallel with the other source, the breaker feedbacks, the voltage, frequency and phase angle are still monitored. The device finish the transfer if all parameters are matched.

YES..... In the moment being parallel with the other source the breaker feedback signals only determines the closed transition time. With successful closure of the intended source the other source is opened.

Triggering of the "Fail to close S1" failure

This failure is triggered if the following conditions are met:

- Source 1 is available
- The ATS controller has issued the C1 signal (*LogicsManager* flag (20.07)) to close to source 1

As soon as the C1 signal (command: close to source 1) is issued, the "Limit switch reply timeout" timer (parameter 3428) starts to count and the period for monitoring whether the S1 reply (closed to source 1) is fed back from the ATS switch to the controller starts. The C1 signal is enabled until the "Limit switch reply timeout" timer has expired. Thus, this defines maximum permissible pulse duration for the transfer command. If the "Limit switch reply timeout" timer has expired, the C1 signal will be disabled. If the "Wait time until next XFR attempt" timer (parameter 3429) has expired, the C1 signal will be enabled again and the "Limit switch reply timeout" timer is restarted. The fail to close S1 failure is issued after exceeding the configured maximum number of attempts. The message "Fail to close S1" will be displayed and entered into the event logger.

If the reply from the ATS controller is detected while the "Limit switch reply timeout" timer is still counting, the C1 signal will be disabled immediately since the transfer was successful. The message is not being displayed anymore and the reply monitoring is terminated.

NOTE

Closing the ATS switch will be attempted until the maximum number of unsuccessful transition attempts (parameter 3427) is reached. The failure will be issued after the last failed transfer attempt.

Additional function Monitor breaker closing

The monitor “breaker closing” ID4568 triggers also a “Fail to close S1” failure. Refer to “Monitor breaker closing” for better understanding.

Triggering of the "Fail to close S2" failure

This failure is triggered if the following conditions are met:

- Source 2 is available
- The ATS controller has issued the C2 signal (*LogicsManager* flag (20.09)) to close to source 2

As soon as the C2 signal (command: close to source 2) is issued, the "Limit switch reply timeout" timer (parameter 3428) starts to count and the period for monitoring whether the S2 reply (closed to source 2) is fed back from the ATS switch to the controller starts. The C2 signal is enabled until the "Limit switch reply timeout" timer has expired. Thus, this defines maximum permissible pulse duration for the transfer command. If the "Limit switch reply timeout" timer has expired, the C2 signal will be disabled. If the "Wait time until next XFR attempt" timer (parameter 3429) has expired, the C2 signal will be enabled again and the "Limit switch reply timeout" timer is restarted. The fail to close S2 failure is issued after exceeding the configured maximum number of attempts. The message "Fail to close S2" will be displayed and entered into the event logger.

If the reply from the ATS controller is detected while the "Limit switch reply timeout" timer is still counting, the C2 signal will be disabled immediately since the transfer was successful. The message is not being displayed anymore and the reply monitoring is terminated.

NOTE

Closing the ATS switch will be attempted until the maximum number of unsuccessful transition attempts (parameter 3427) is reached. The failure will be issued after the last failed transfer attempt.

Additional function Monitor breaker closing

The monitor “breaker closing” ID4569 triggers also a “Fail to close S2” failure. Refer to “Monitor breaker closing” for better understanding.

NOTE

If a closure failure occurs, the system always tries to close the second breaker to a good source.

Triggering of the "Fail to open S1" failure

This failure is triggered if the following conditions are met:

- Source 2 is available
- The ATS controller has issued the C1O signal (*LogicsManager* flag (20.08)) to open source 1

As soon as the C1O signal (command: open source 1) is issued, the "Limit switch reply timeout" timer (parameter 3428) starts to count and the period for monitoring whether the S1O reply (source 1 is open) is fed back from the ATS switch to the controller starts. The C1O signal is enabled until the "Limit switch reply timeout" timer has expired. Thus, this defines maximum permissible pulse duration for the transfer command. If the "Limit switch reply timeout" timer has expired, the C1O signal will be disabled. If the "Wait time until next XFR attempt" timer (parameter 3429) has expired, the C1O signal will be enabled again and the "Limit switch reply timeout" timer is re-started. If the timer expires again without detecting the S1O reply, the "Fail to open S1" failure is issued. The message "Fail to open S1" will be displayed and entered into the event logger.

If the reply from the ATS controller is detected while the "Limit switch reply timeout" timer is still counting, the C1O signal will be disabled immediately since the transfer was successful. “Fail to open S1” will not be displayed and reply monitoring is terminated.

NOTE

Opening the ATS switch will be attempted until the maximum number of unsuccessful transition attempts (parameter 3427) is reached. The failure will be issued after the last failed transfer attempt.

Triggering of the "Fail to open S2" failure

This failure is triggered if the following conditions are met:

- Source 1 is available
- The ATS controller has issued the C2O signal (*LogicsManager* flag (20.10)) to open source 2

As soon as the C2O signal (command: open source 2) is issued, the "Limit switch reply timeout" timer (parameter 3428) starts to count and the period for monitoring whether the S2O reply (source 2 is open) is fed back from the ATS switch to the controller starts. The C2O signal is enabled until the "Limit switch reply timeout" timer has expired. Thus, this defines maximum permissible pulse duration for the transfer command. If the "Limit switch reply timeout" timer has expired, the C2O signal will be disabled. If the "Wait time until next XFR attempt" timer (parameter 3429) has expired, the C2O signal will be enabled again and the "Limit switch reply timeout" timer is re-started. If the timer expires again without detecting the S2O reply, the "Fail to open S2" failure is issued. The message "Fail to open S2" will be displayed and entered into the event logger.

If the reply from the ATS controller is detected while the "Limit switch reply timeout" timer is still counting, the C2O signal will be disabled immediately since the transfer was successful. “Fail to open S2” will not be displayed and reply monitoring is terminated.

NOTE

Opening the ATS switch will be attempted until the maximum number of unsuccessful transition attempts (parameter 3427) is reached. The failure will be issued after the last failed transfer attempt.

Triggering the "Unintended Open S1" or "Unintended Open S2" failure

EN Monitor unintended open
DE Überwach. unerw. Öffnen
CL2 {0} {1} {2}
2649 ✓ ✓ ✓

Monitor Unintended Open *ON/OFF*

This parameter activates the monitoring of unintended breaker opening.
ON..... monitoring is enabled
Off..... monitoring is disabled

This failure is triggered if the following conditions are met:

- A breaker was initially closed
- The ATS controller was not in the process of opening it
- The breaker was opened
- The monitoring was enabled by the parameter "2649 Monitor Unintended Open"

This will undelayed trigger the corresponding alarms. The alarms do not affect the application but they will be displayed on the screen and the corresponding LogicsManager flags can be used.

Monitor breaker closing

EN Number of S1 close retries
DE Anzahl S1 Schließversuche
CL2 {0} {1} {2}
4568 ✓ ✓ ✓

Number of S1 close retries **1 to 20**

The monitor checks whether the S1 breaker remains closed after it has been switched on. If it opens again on its own within 5 seconds of being switched on, this switching attempt is deemed to be faulty, and an error counter is incremented. The limit to be entered here determines how often a new switch-on attempt may be started before the “Fail to close S1” failure is triggered.
Refer to chapter “Triggering of the "Fail to close S1" failure" for more information.

EN Number of S2 close retries
DE Anzahl S2 Schließversuche
CL2 {0} {1} {2}
4569 ✓ ✓ ✓

Number of S2 close retries **1 to 20**

The monitor checks whether the S2 breaker remains closed after it has been switched on. If it opens again on its own within 5 seconds of being switched on, this switching attempt is deemed to be faulty, and an error counter is incremented. The limit to be entered here determines how often a new switch-on attempt may be started before the “Fail to close S2” failure is triggered.
Refer to chapter “Triggering of the "Fail to close S2" failure" for more information.

NOTE

The according breaker close failure counter will be reset if

- The intent breaker is continuously closed for 5 seconds
- The alarm was triggered

Additionally

Configured transfer switch type "Standard”:

- Switch over to the other side

Configured transfer switch type "Delayed” or “Close”:

- Open of the mentioned side or close to the other side

Test Modes

There are two different types of system tests:

- Load Test
  This is a test with load transfer. If a load test is requested, a failure of the preferred source will be simulated. The non-preferred source will be started and load will be transferred to the non-preferred source.
  This test serves to ensure that the complete system is ready for operation in case of a real failure of the preferred source.

- No Load Test
  This is an engine test. If a no load test is requested, only the non-preferred source will be started, but no load transfer will be performed.
  This test serves to ensure that the non-preferred source is starting and running properly.

NOTE

A "No Load Test" may only be performed if the non-preferred source is a generator.

If the *LogicsManager* function "Load Test" becomes TRUE (by energizing a DI for example), a load test will be performed.

EN / DE			Load Test / Lastprobe
CL2 12640	{0} ✓	{1} ✓	{2} ✓

Load Test *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

If the *LogicsManager* function "No Load Test" becomes TRUE (by energizing a DI for example), a no load test will be performed.

EN / DE			No Load Test / Motor Test
CL2 12650	{0} ---	{1} ✓	{2} ✓

No Load Test *LogicsManager*

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

Timer Exerciser

This feature allows configuring up to 12 independent times, at which either a load test or a no-load test is performed. For this, 12 independent timers are available, to configure a recurring or single-time event, on which either a load test or a no-load test can be started.

If such a configured time is reached, a *LogicsManager* command variable (20.20 for load test, and 20.21 for no-load test) will be enabled for the configured duration, which again can be used to enable the *LogicsManager* functions "Load Test" (parameter 12640) or "No Load Test" (parameter 12650).

A load test will only be performed if command variable 20.20 is enabled and the "Load Test" *LogicsManager* function is configured accordingly.

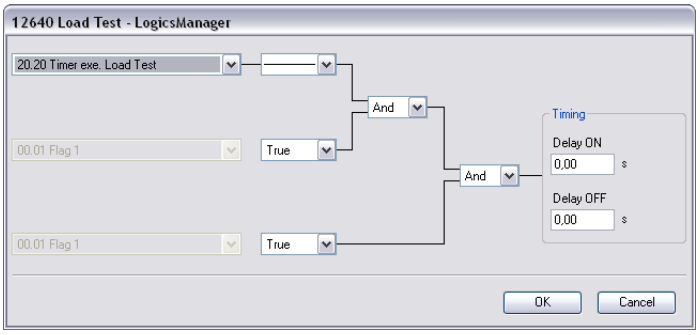

Figure 3-21: Test modes - load test configured for timer exerciser

A no-load test will only be performed if command variable 20.21 is enabled and the "No Load Test" *LogicsManager* function is configured accordingly.

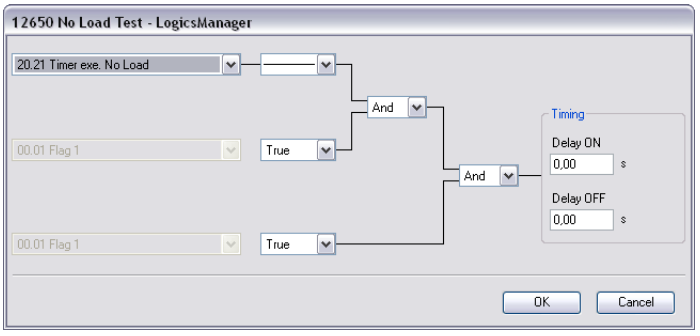

Figure 3-22: Test modes - no-load test configured for timer exerciser

The timer exercisers 1 through 12 have identical parameters for configuring the exercise time. The parameters for timer exerciser 1 are described in the following:

		Exerciser Type	
EN		Testzyklus Art	
CL2 6490	{0} ✓	{1} ✓	{2} ✓

Exerciser type — **Off / Daily / Weekly / 14-Day / 28-Day / 365-Day / One Event**

Off..... This exercise timer is disabled
Daily..... A daily exercise will be performed at the configured time
Weekly..... A weekly exercise will be performed at the configured time
14-Day ..... A biweekly (every 14 days) exercise will be performed at the configured time starting with a configured date
28-Day ..... A four-weekly (every 28 days) exercise will be performed at the configured time starting with a configured date
365-Day..... A yearly (every 365 days) exercise will be performed at the configured time starting with a configured date
One Event.... A one-time exercise will be performed at the configured date and time.

NOTE

Depending on the setting of the "Exerciser type" (parameter 6490), some of the following settings are not important (i.e. if a daily exercise is configured, the exerciser day of week is not important, for example).

6537	Exerciser test type	No Load

Figure 3-27: Test modes - configuring exerciser 4 for a one event exercise

* N/A means that this setting is not important for the respective Exerciser Type

If an exercise event is pending at the current date, this is indicated by the *E* in the start screen. This *E* is displayed until the exercise event has expired. Moreover, the date of the next event is displayed in the configuration screen of the respective event exerciser.

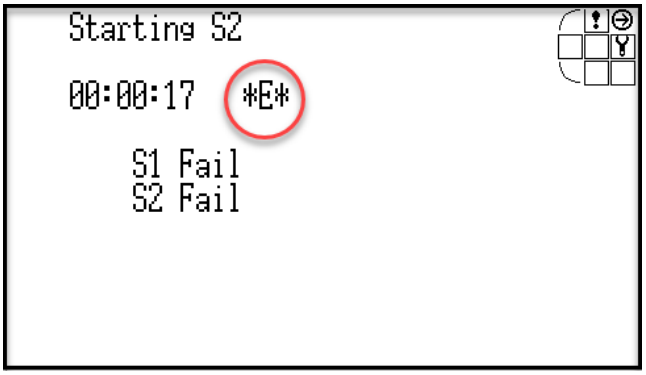

Figure 3-28: Test modes - display screen with pending exercise event

If a Load Test is currently running (the load is supplied by the non-preferred source), the remaining test time is displayed as a count-down timer. The running test may be terminated using the Bypass button.

Monitoring

Monitoring: Alarm Acknowledgement

EN Time until horn reset
DE Zeit Hupenreset
CL2 {0} {1} {2}
1756 ✓ ✓ ✓

Self acknowledgment of the centralized alarm (horn) **0 to 1,000 s**

After each alarm occurs, the alarm LED flashes and the command variable 03.05 (horn) is issued. After the delay time 'time until horn reset' has expired, the flashing LED changes into a steady light and the command variable 03.05 (horn) is reset. The alarm LED is illuminated continuously until the alarm has been acknowledged.

Note: If this parameter is configured to 0, the horn will remain active until it will be acknowledged.

EN External acknowledge
DE Ext. Quittierung
CL2 {0} {1} {2}
12490 ✓ ✓ ✓

Protection: External acknowledgment of alarms ***LogicsManager***

It is possible to acknowledge all alarms simultaneously from remote, e.g. with a discrete input. The command variables of the *LogicsManager* have to become TRUE twice.

ⓘ The first high signal into the discrete input acknowledges the command variable 03.05 (horn). The second high signal acknowledges all inactive alarm messages.

The ON-delay time is the minimum time the input signals have to be "1". The OFF-delay time is the time how long the input conditions have to be "0" before the next high signal is accepted.

The *LogicsManager* and its default settings are explained in Appendix A: "*LogicsManager*".

Monitoring: Limit Switch Monitoring

EN Limit switch monitoring
DE Rückmeldungswächter
CL2 {0} {1} {2}
3430 ✓ ✓ ✓

Limit switch monitoring **ON / OFF**

Limit switch monitoring evaluates the ATS limit switch replies and checks them after limit switch failure delay time (3463) for plausibility with reference to the operating state. If the replies are not plausible, the "Actual" and "Expected" replies are displayed.
Meanwhile, the status of the breaker replies cannot be reset with the Reset button and all further transfers are inhibited.

A table with the actual and expected replies may be found in the Operation Manual 37941.
ON .....The replies of the ATS limit switch are evaluated and compared with the expected replies.
OFF .....The replies of the ATS limit switch are not evaluated.

Note: Do not enable this monitoring function before the system is commissioned and fully operational. Otherwise, missing reply signals would lead to a limit switch failure, which blocks the control unit. This can only be solved by wiring the reply signals correctly or disabling this function using ToolKit. The Limit switch failure can be reset with Reset Limit Switch Failure (12891).

EN Limit switch failure delay time
DE Rückmeldungswächter Verzög.
CL2 {0} {1} {2}
3463

Limit switch failure delay time **0.00 to 10.00 s**

Depending on application switching process has an impact on the limit switch monitoring signal (e.g. for EMC reasons). Limit Switch Failure Delay Time (3463) enables to eliminate known impact by waiting for stable signaling.

The preset value of 0.02 s is based on experience and valid for standard application environment.

Note: The theoretically possible setting 0.00s would permanently trigger limit switch monitoring (3430) – may be used for test.

EN Reset limit switch failure
DE Rückmeldungswächter rücksetzen.
CL2 {0} {1} {2}
12891 ✓ ✓ ✓

External acknowledgment of Limit switch failure ***LogicsManager***

It is possible to acknowledge Limit Switch Failure from remote (alternatively to the Reset button on display), e.g. with a discrete input. The command variables of the *LogicsManager* have to become TRUE.

The *LogicsManager* and its default settings are explained on page 125 in Appendix A: "*LogicsManager*".

DE Verzögerung
CL2 3914 {0} ✓ {1} ✓ {2} ✓

Source 1 voltage imbalance delay **0.02 to 99.99 s**

If the monitored voltage imbalance of source 1 exceeds the threshold value for the delay time configured here, an alarm will be issued.

Monitoring: Source 1 Monitoring: Phase Rotation

CAUTION

Please ensure during installation that all voltages applied to this unit are wired correctly to both sides of the circuit breaker. Failure to do so may result in damage to the control unit and/or generation equipment due to closing the breaker asynchronous or with mismatched phase rotations and phase rotation monitoring enabled at all connected components (engine, generator, breakers, cable, busbars, etc.).

This function may block a connection of systems with mismatched phases systems only under the following conditions:

- **The voltages being measured are wired correctly with respect to the phase rotation at the measuring points (i.e. the voltage transformer in front and behind the circuit breaker)**
- **The measuring voltages are wired without angular phase shift or interruption from the measuring point to the control unit**
- **The measuring voltages are wired to the correct terminals of the control unit (i.e. L1 of the generator is connected with the terminal of the control unit which is intended for the L1 of the generator)**

Correct phase rotation of the phase voltages ensures that damage will not occur during a transfer to either source 1 or source 2. The voltage phase rotation monitoring checks the phase rotation of the voltages and the configured phase rotation to ensure they are identical. The directions of rotation are differentiated as "clockwise" and "counter-clockwise". With a clockwise field the direction of rotation is "L1-L2-L3"; with a counterclockwise field the direction of rotation is "L1-L3-L2". If the control is configured for a clockwise rotation and the voltages into the unit are calculated as counterclockwise the alarm will be initiated.
A connection to any source can occur only if the incoming source has the correct phase sequence in relation to the source that is connected to the load. No transfer will occur if the incoming source has an incorrect phase sequence with this parameter enabled.

If the monitored voltage imbalance of source 2 exceeds the threshold value for the delay time configured here, an alarm will be issued.

Monitoring: Source 2 Monitoring: Phase Rotation

CAUTION

Please ensure during installation that all voltages applied to this unit are wired correctly to both sides of the circuit breaker. Failure to do so may result in damage to the control unit and/or generation equipment due to closing the breaker asynchronous or with mismatched phase rotations and phase rotation monitoring enabled at all connected components (engine, generator, breakers, cable, busbars, etc.).

This function may block a connection of systems with mismatched phases systems only under the following conditions:

- **The voltages being measured are wired correctly with respect to the phase rotation at the measuring points (i.e. the voltage transformer in front and behind the circuit breaker)**
- **The measuring voltages are wired without angular phase shift or interruption from the measuring point to the control unit**
- **The measuring voltages are wired to the correct terminals of the control unit (i.e. L1 of the generator is connected with the terminal of the control unit which is intended for the L1 of the generator)**

Correct phase rotation of the phase voltages ensures that damage will not occur during a transfer to either source 1 or source 2. The voltage phase rotation monitoring checks the phase rotation of the voltages and the configured phase rotation to ensure they are identical. The directions of rotation are differentiated as "clockwise" and "counter-clockwise". With a clockwise field the direction of rotation is "L1-L2-L3"; with a counterclockwise field the direction of rotation is "L1-L3-L2". If the control is configured for a clockwise rotation and the voltages into the unit are calculated as counterclockwise the alarm will be initiated.
A connection to any source can occur only if the incoming source has the correct phase sequence in relation to the source that is connected to the load. No transfer will occur if the incoming source has an incorrect phase sequence with this parameter enabled.

ON .....Phase rotation monitoring is performed for source 2.

EN S2 phase rotation
DE S2 Drehfeld
CL2 4567 {0} ✓ {1} ✓ {2} ✓

Source 2 phase rotation **CW / CCW**

This parameter configures the phase rotation of the system. If a different phase rotation is detected at source 2, source 2 is considered as "not OK" and a transfer to source 1 is initiated.

CW .....The three-phase measured Source 2 voltage is rotating CW (clockwise; that means the voltage rotates in direction L1-L2-L3; standard setting).
CCW .....The three-phase measured Source 2 voltage is rotating CCW (counter-clockwise; that means the voltage rotates in direction L1-L3-L2; standard setting).

Monitoring: In-Phase Monitoring (Synch Check)

The in-phase monitoring function is used to determine whether the phase angles of the preferred source and the non-preferred source are in phase, i.e. whether the relative phase difference of the two sources is within specified limits.
Whenever one power source fails, the control follows the programmed transition operation sequence. If in-phase monitoring is enabled and both sources are available as determined by the "restore value" levels, the control shall follow the in-phase monitoring operation sequence.

In-phase Monitoring may be used to improve the transfer with open transition switches. An open (standard) transition transfer switch is the most simple and commonly used ATS. It may only take on two positions, connected with source 1, or connected with source 2. If it transfers a load, this will be performed according to the break-before-make process, i.e. the load will be disconnected from the previous source before it will be connected with the next source. This results a dead time of approximately 160 ms (depending on the ATS) during which the load is not connected to a source. Most of the load consumers are not affected by this dead time in the transfer phase (lamps may only flicker, etc.), but some appliances may be effected seriously, like computers and motor loads, etc. This could lead up data loss or equipment damage. The problem is that the consumers behave like generators during this dead time and supply power. While some consumers are running out when changing to the other source, very high current may flow between generator and load because the phase angles between the two systems are not synchronous.

This high equalizing current may be minimized by two means:

- Using a transfer switch with neutral position
  If delayed transition is used, the residence time in neutral position can be extended long enough before transfer for the voltages at the load to decay.
- Using inphase monitoring
  Inphase monitoring checks the phase angle between source 1 and source 2 prior to a transfer and enables the transfer signal only if the phase angle has fallen below a configured threshold. Moreover, the unit calculates the leading angle for the closing commands by entering the "Switch reaction time" to enable a transfer with almost 0° phase shift. This ensures a nearly synchronous transfer to the other source and reduces the equalizing current to a minimum. Compared with the neutral position of a delayed transition switch, the advantage is that the load must not be shut down completely prior to a transfer.

Inphase monitoring may be used with open, delayed, and closed transition switches. As mentioned above, high equalizing current after a transfer may be minimized when utilizing inphase monitoring. However, the behavior of the ATS in case of a failed inphase transition must be considered. This may happen if the generator is equipped with a poorly adjusted frequency controller. Then, it may happen that it is not possible to achieve synchronicity. But the load must be transferred to the other source in any case.

NOTE

Refer to parameter 4582 "Outcome on in-phase timeout" for the ATS behavior in case of a failed inphase transition.

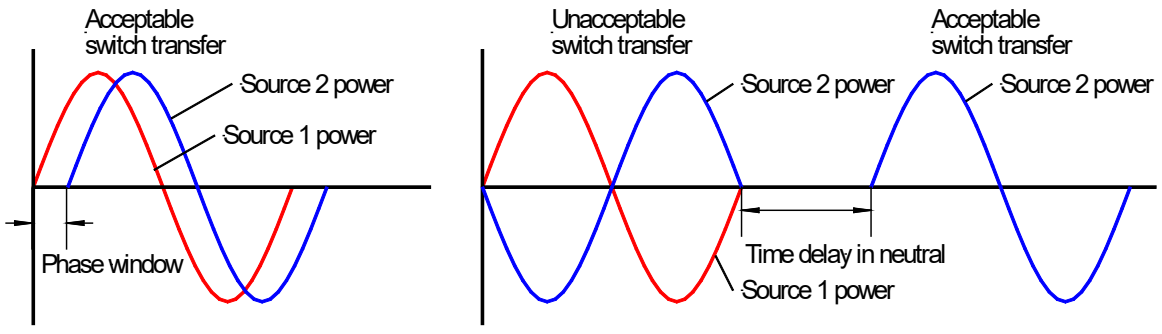

Figure 3-29: Inphase monitoring

Monitoring: In-phase Monitoring: Parameters

EN / DE			
	In-Phase monitor		
	Synchrocheck		
CL2	{0}	{1}	{2}
4570	✓	✓	✓

In-phase monitoring **ON / OFF**

This parameter configures, whether in-phase monitoring is performed.
OFF .....No in-phase monitoring is performed prior to a transfer.
ON .....In-phase monitoring is performed prior to a transfer. If the phase angle between both systems is within the permissible limits, the transfer will be performed.

NOTE

If in-phase monitoring is enabled and the measurement principle for source 1 (parameter 1862) is configured as "1Ph 2W", the measurement principle for source 2 (parameter 1861) must also be configured as "1Ph 2W".

Monitoring: Load transfer between two utility sources with special (phase angle) conditions

NOTE

To transfer the load between two utility sources for a self adjusted phase angle range is valid for application mode UTIL-UTIL only.

Monitoring: Connect synchronous mains: Parameters

EN / DE			
	Connect synchronous mains		
	Synchrones Netz anschließen		
CL2	{0}	{1}	{2}
8820	✓	---	---

Connect synchronous mains **ON / OFF**

This parameter configures, whether special in-phase monitoring is performed if the phase angle between both mains voltages is in a defined range. This range is defined from zero to the value of parameter 8821 Max. phase angle (see below).
OFF .....In-phase monitoring is performed as configured with parameter 4570 In-phase monitoring (see above).
ON .....Special in-phase monitoring is performed prior to a transfer. If the phase angle between both systems is within the adjusted limits, the transfer will be performed.

Monitoring: Max. phase angle: Parameters

EN / DE			
	Max. phase angle		
	Max. Phasenwinkel		
CL2	{0}	{1}	{2}
8821	✓	---	---

Maximum phase angle **2° to 20°**

This parameter configures the maximum admissible phase angle between both voltage systems in case of connecting synchronous mains.
The monitored range starts from 0 (zero) and goes through the value set with this parameter.
Example:
If the Max. phase angle is set to 10,
the covered range for the phase angle is 0° … 10°.

EN In-phase check for DLY trans.
DE Sync bei verzögertem Transfer

CL2	{0}	{1}	{2}
4585	✓	✓	✓

Inphase check for DLY trans **ON / OFF**

Note: This parameter is used only if “Delayed” transition mode is selected.

OFF..... If parameter “Transfer switch type” is set to “Delayed”, and this parameter is “Off”, then no In-Phase check will be performed even if parameter “In-phase monitor” is configured to “On”. The system will always transfer using timed neutral position in account during each transfer.

ON..... If the “Transfer switch type” is set to “Delayed”, and this parameter is set to “On”, then the In-Phase monitoring is also active for a delayed transition transfer. If transferring between two live sources (S1 & S2) In-Phase check will always be performed and the “Neutral” position timer will be automatically bypassed.

Application example:

1..... Parameter “Transfer switch type” is configured to “Closed”
2..... Parameter “In-phase monitor” is configured to “On”
3. LogicsManager “Delayed mode act.” is used, to switch between operating modes “Delayed and Closed” transition via an externally mounted Keyswitch.

Note: During commissioning it can happen that the utility company does not allow closed transition transfers between two sources unless they have permitted the ATS system owner to do it. In that case a key-switch can be installed to the ATS cabinet to toggle the operating modes between “Closed” and “Delayed” transition. If set to “Closed” transition mode, the DTSC-200A will always perform in-phase transfers between the two sources. If the customer switches the transition mode to “Delayed” (via the external keyswitch) and he does not want the “In-Phase monitor” to be active, the parameter “In-Phase check for DLY transfer” shall be set to “Off”. This ensures that “In-phase monitoring” is definitely deactivated for delayed transition transfers even if parameter “In-phase monitor” is configured to “On”. If the customer switches the Keyswitch back to “closed” transition mode, then the system will perform closed transition transfers.

EN Voltage window
DE Spannungsdifferenz
CL2 4571 {0} ✓ {1} ✓ {2} ✓

Voltage window for synchronization **0.50 to 20.00 %**

ⓘ This value refers to the Rated voltage Source 1/2 (parameters 1774/1772 on page 25).

This parameter configures the maximum permissible voltage difference in each of the three phases. The voltage differences in all three phases ($V_{L1\ (Source\ 1)}$ - $V_{L1\ (Source\ 2)}$ / $V_{L2\ (Source\ 1)}$ - $V_{L2\ (Source\ 2)}$ / $V_{L3\ (Source\ 1)}$ - $V_{L3\ (Source\ 2)}$) must be within the limit configured here to be able to synchronize.
If the voltage difference in at least one phase exceeds this limit, the synchronization will not be enabled.

EN Positive frequency window
DE Maximaler Schlupf
CL2 4572 {0} ✓ {1} ✓ {2} ✓

Positive frequency window for synchronization **0.02 to 0.49 Hz**

This parameter configures the maximum permissible positive frequency difference between source 2 and source 1 (Δf = S2-S1).
If the frequency difference is not within the limits configured here, the synchronization will not be enabled because the frequency difference of the source to be connected to is too high.

EN Negative frequency window
DE Maximaler Schlupf
CL2 4573 {0} ✓ {1} ✓ {2} ✓

Negative frequency window for synchronization **-0.02 to -0.49 Hz**

This parameter configures the minimum permissible negative frequency difference between source 2 and source 1 (Δf = S2-S1).
If the frequency difference is not within the limits configured here, the synchronization will not be enabled because the frequency difference of the source to be connected to is too low.

Maximum Overlap Time

NOTE

This function is only effective if the transfer switch type (parameter 3424) is configured to "Closed" and in-phase monitoring (parameter 4570) is enabled.

NOTE

If the *LogicsManager* function "Extended parallel time" (parameter 12860) is TRUE, the maximum overlap time is not effective.

If a closed transition is performed, the overlap time of the make-before-break process, in which both sources are parallel, is less than 100 ms. If this time is to be extended, an overlap timer is available to keep the transition switch in overlap position for a configured time. The timer starts as soon as the transition switch is in overlap position. The source, from which the transfer has been initiated, will be disconnected and the load will be supplied by the new source as soon as this timer has expired.

EN	Max. overlap time		
DE	Max. Synchronzeit		
CL2	{0}	{1}	{2}
4577	✓	✓	✓

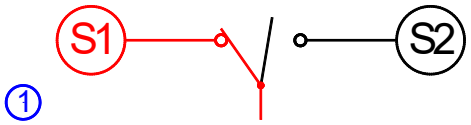
Maximum overlap time **0.1 to 9.99 s**

0.11 - 9.99 .... The time for which the transfer switch shall remain in overlap position is configured here.
0.10..... **Special case:** With this setting Overlap times below 100 ms are possible if transfer switch is fast enough.

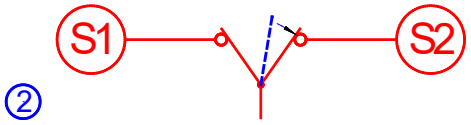
NOTE

If one source fails before this timer expires, the failed source will automatically be disconnected.

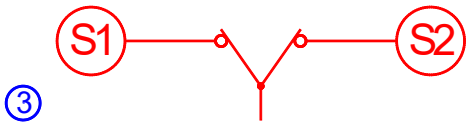
The following example shows a typical transfer sequence from source 1 to source 2 with overlap timer:



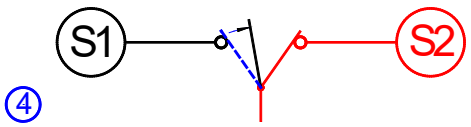
Initial situation:
Load is supplied by source 1.



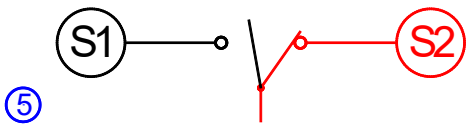
A transfer is initiated (e.g. by a load test):
As soon as source 2 is detected as stable and synchronicity is achieved, the transfer switch is closed to source 2.



Overlap timer is active:
The transfer switch remains in overlap position as long as the overlap timer has not expired and load is supplied by both sources.



Maximum overlap time expires:
As soon as the configured maximum overlap time has expired, the transfer switch opens from source 1.



Final situation:
Load is supplied by source 2.

Switch Reaction Time Configuration

DE Schaltzeit bei nicht Überlapp.

	{0}	{1}	{2}
CL2 4578	✓	✓	✓

Open transition switch reaction time **15 to 300 ms**

The time, which is required by the switch in open transition mode to open from one source and close to the other source, is configured here.
This time is required for calculating the lead angle for inphase transfers.

EN Closed trans. Switch reac. Time
DE Schalterzeit bei Überlapp.

	{0}	{1}	{2}
CL2 4583	✓	✓	✓

Closed transition switch reaction time **15 to 300 ms**

The time, which is required by the switch in closed transition mode to close to the other source to parallel, is configured here.
This time is required for calculating the lead angle for inphase transfers.

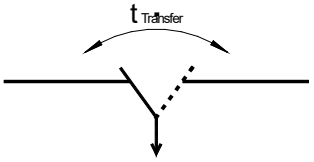

Figure 3-30: Switch reaction time

Vector Group Angle Adjustment

WARNING

It is critical that the following parameter is configured correctly to prevent incorrect synchronization settings. This parameter cannot compensate for incorrect wiring of the system!

EN Vector group angle adjustment
DE Schaltgruppe Winkel Anpassung

	{0}	{1}	{2}
CL2 4581	✓	✓	✓

Vector group angle adjustment **-180° to 180°**

This parameter compensates phase angle deviations, which can be caused by transformers (e.g. a delta to wye transformer) located within the electrical system. Ensure the following parameters are configured correctly to prevent erroneous synchronization settings. Incorrect wiring of the system cannot be compensated for with this parameter.

Please act as follows: If a transformer is not located between source S1 and S2 or if the transformer has a vector group without a phase angle deviation, then a phase angle deviation of 0° should be configured in this parameter.

NOTE: *Further information can be found in chapter "Commissioning Note" on the next page.*

WARNING: *Ensure this parameter is configured correctly to prevent erroneous synchronization settings. Incorrect wiring of the system cannot be compensated for with this parameter.*

Outcome on Inphase Timeout

EN In-phase timeout after
DE Synchr. Zeitüberschr.
CL2 4576 {0} ✓ {1} ✓ {2} ✓

Inphase timeout after **0 to 6,500 s**

This parameter configures the maximum time for attempting to detect synchronization. This timer starts to count as soon as inphase monitoring is enabled prior to a transfer. If synchronicity is detected between the two sources, the transfer command will be issued. The timer will be bypassed.

EN Outcome on In-phase timeout
DE Aktion bei Sync. Zeitüberschr.
CL2 4582 {0} ✓ {1} ✓ {2} ✓

Outcome on inphase timeout **Abort / Delayed**

This parameter determines the behavior of the unit after unsuccessful synchronization using the following 2 options:

Abort ..... The transfer will be aborted.
Delayed..... A delayed transition will be performed.

Example:
If a load test is requested and inphase monitoring is enabled (parameter 4570 is configured to "ON"), the inphase timeout timer (parameter 4576) starts prior to a transfer and the unit attempts to detect synchronization between the two sources. If no synchronization can be detected before the timer expires (because of a misadjusted voltage or speed controller at the engine for example), the behavior configured here determines the further transfer proceeding.

If **Abort** is configured here, the complete transfer request will be aborted. This means that all remote start requests (like load test) will be ignored if they are still present and the system will remain on the available source.

If **Delayed** is configured here, a delayed transition will be performed. This means that the switch changes to neutral position for a configured time to ramp down connected motor loads before it changes to the other source. This is important for de-energized motors to ramp down, because, for a short time, they act as generators.

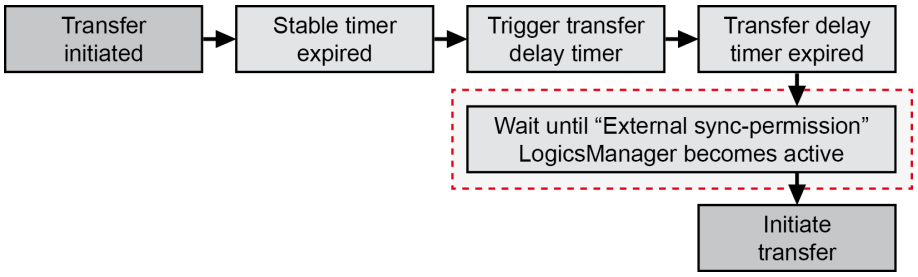
Note: This function may only be used, if "Delayed" or "Closed" is configured as "Transfer switch type" (parameter 3424). If "Standard" is configured as "Transfer switch type" (parameter 3424) and "Outcome on In-phase timeout" is configured to "Delayed", the unit behaves as if "Abort" would have been configured here.

External sync. permission

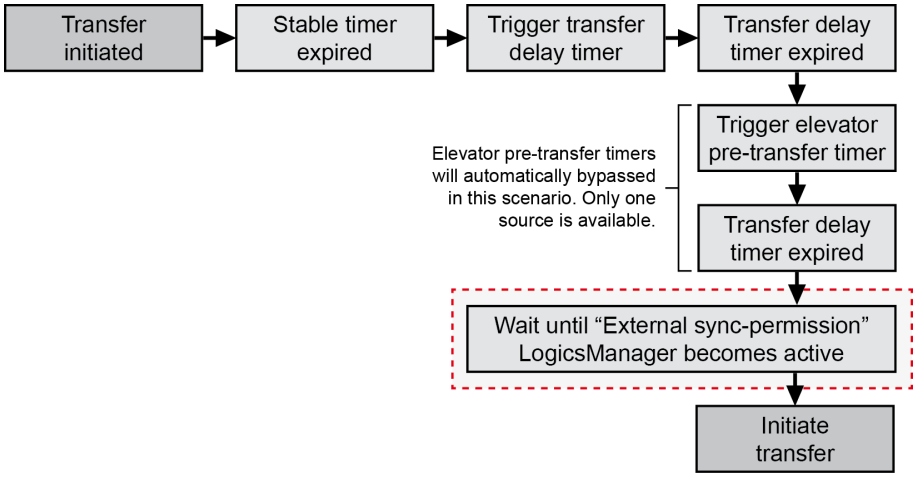
This parameter allows to externally control the in-phase monitoring function. “Closed transfer enable” (parameter 12880) LogicsManager statement must be made logically “TRUE” for operation of parameter 4584.

Examples external sync permission:

Scenario 1 ..... Elevator pre-transfer signal is “Disabled”
Motor load disconnect signal is “Disabled”



Scenario 2 ..... Elevator pre-transfer signal is “Enabled”
Motor load disconnect signal is “Disabled”



Scenario 3..... Elevator pre-transfer signal is “Enabled”
Motor load disconnect signal is “Enabled”

Note:
This parameter is only visible if “Ext. permit for cld. trans.” (parameter 4584 is configured to “On”.

Monitoring: Overcurrent

Current is monitored depending on the parameters 1860 "S2 Load current measuring" and 1863 "S1 Load current measuring". Only the current of the source, which is connected to the load, is measured, because the CT is located at the load connection. The load overcurrent alarm contains three limits and can be setup as a step definite time overcurrent alarm as illustrated in the figure below. Monitoring of the maximum phase current is performed in three steps. Every step can be provided with a delay time independent of the other steps.
If this protective function is triggered, the alarm list indicates "**`Overcurrent 1`**", "**`Overcurrent 2`**", or "**`Overcurrent 3`**".

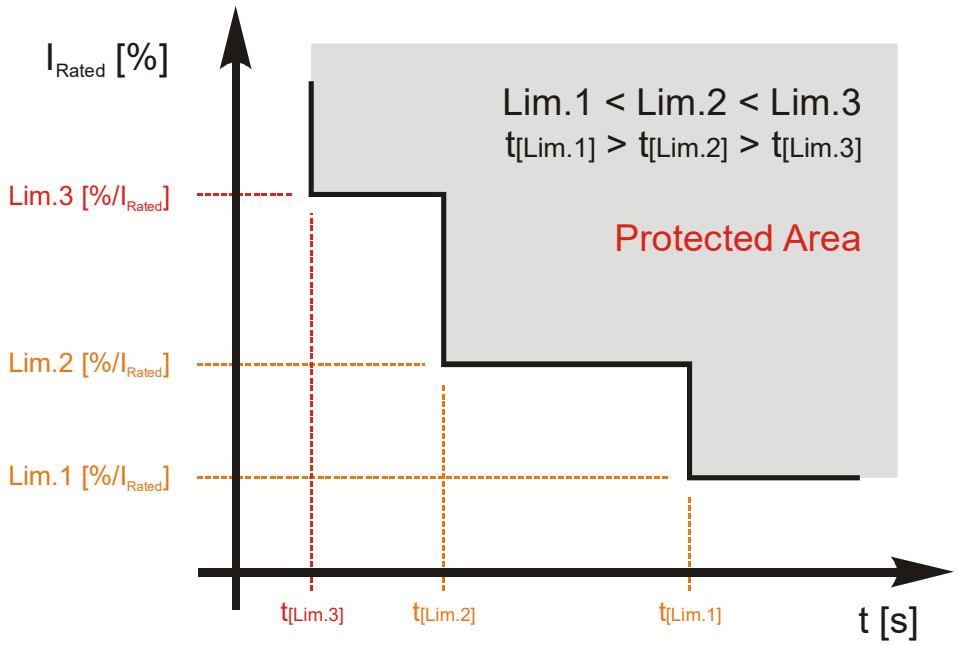

Figure 3-31: Monitoring - load time-overcurrent

Parameter table

The parameters represented in this table are specified in the following, whereas the description is identical for all levels; the levels may only differ in their setting ranges.

Level	Text	Setting range	Standard value
Overcurrent (the hysteresis is 1 % of the rated value)			
Level 1	Monitoring	ON / OFF	ON

2214

Load overcurrent, TOC: Self acknowledgment (Level 1/Level 2/Level 3) **ON / OFF**

YES..... The control automatically clears the alarm if it is no longer valid.
NO..... An automatic reset of the alarm does not occur. The reset occurs manually by pressing the appropriate buttons, by activating the *LogicsManager* output "External acknowledgement" via an discrete input, or via an interface.

Monitoring: Overload

Power is monitored depending on the parameters 1861 "S2 voltage measuring", 1862 "S1 voltage measuring", 1860 "S2 Load current measuring" and 1863 "S1 Load current measuring". Only the power of the source, which is connected to the load, is measured, because the CT is located at the load connection. If the real power is above the configured limit an alarm will be issued.
If this protective function is triggered, the alarm list indicates "**`Overload 1`**" or "**`Overload 2`**".

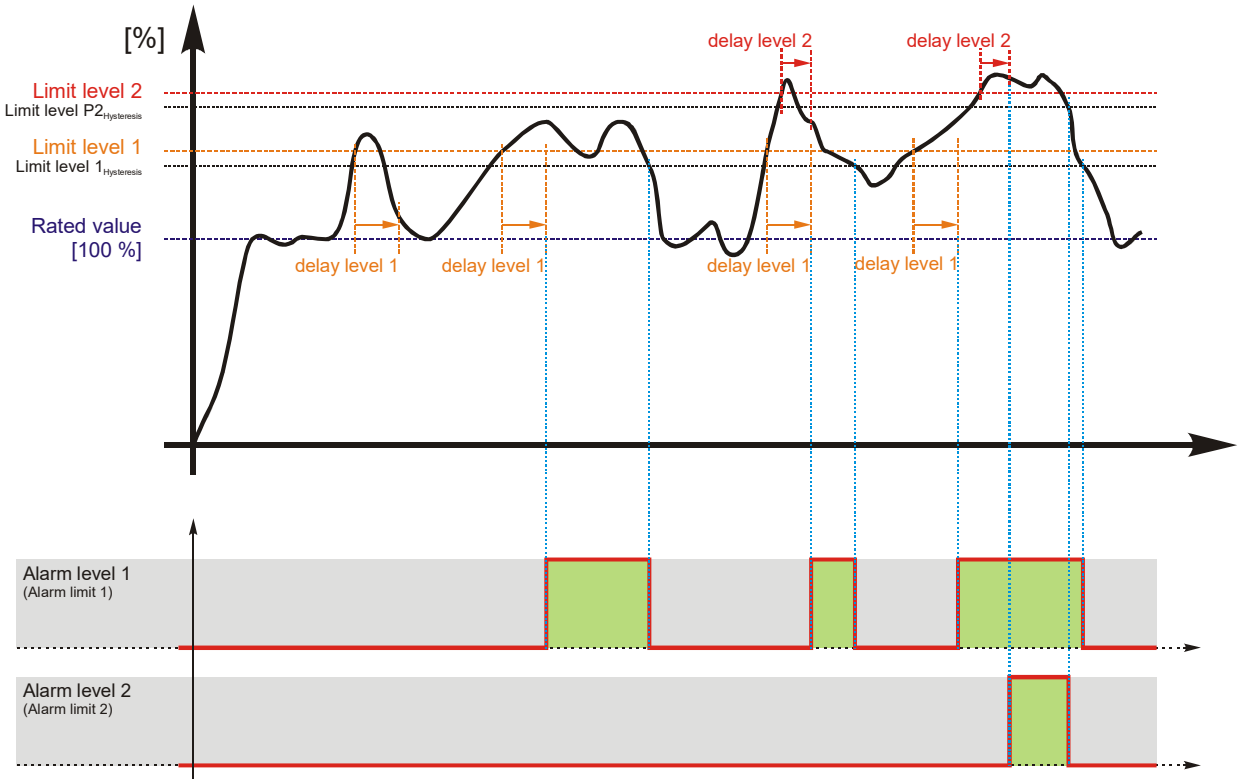

Figure 3-32: Monitoring - overload

Parameter table

The parameters represented in this table are specified in the following, whereas the description is identical for all levels; the levels may only differ in their setting ranges.

Overload: Self acknowledgment (Level 1/Level 2) **YES / NO**

YES..... The control automatically clears the alarm if it is no longer valid.
NO..... An automatic reset of the alarm does not occur. The reset occurs manually by pressing the appropriate buttons, by activating the *LogicsManager* output "External acknowledgement" via an discrete input, or via an interface.

Monitoring: Engine, Start Failure Source 1

If this protective function is triggered, the alarm list indicates "**`Start Fail S1`**".

EN	S1 start fail delay time		
DE	S1 Startfehler Zeit		
CL2	{0}	{1}	{2}
3341	---	---	✓

Source 1 start fail: delay time **1 to 6500 s**

If the "S1 start delay" timer has expired, the engine start signal will be issued. If the "engine start" relay de-energizes, "Source 1 start fail delay" timer starts to count. Now, the controller expects the engine to start within the time configured here. If this time will be exceeded, a "Start Fail S1" alarm will be issued.

If this timer is running, the "Starting S1" message is displayed.

This parameter is only visible, if the application mode (parameter 4148) is configured to "Gen-Gen".

Monitoring: Engine, Start Failure Source 2

If this protective function is triggered, the alarm list indicates "**`Start Fail S2`**".

EN	S2 start fail delay time		
DE	S2 Startfehler Zeit		
CL2	{0}	{1}	{2}
3331	✓	✓	✓

Source 2 start fail: delay time **1 to 6500 s**

If the "S2 start delay" timer has expired, the engine start signal will be issued. If the "engine start" relay de-energizes, "Source 2 start fail delay" timer starts to count. Now, the controller expects the engine to start within the time configured here. If this time will be exceeded, a "Start Fail S2" alarm will be issued.

If this timer is running, the "Starting S2" message is displayed.

Monitoring: Battery, Overvoltage

There are two battery overvoltage alarm levels available in the control. Both alarms are definite time alarms and are illustrated in the below figure. The figure diagrams a frequency trend and the associated pickup times and length of the alarms. It should be noted that this figure illustrates a level 1 alarm that is self-acknowledged. Monitoring of the voltage is done in two steps.
If this protective function is triggered, the alarm list indicates "**Batt.overvolt.1**" or "**Batt.overvolt.2**".

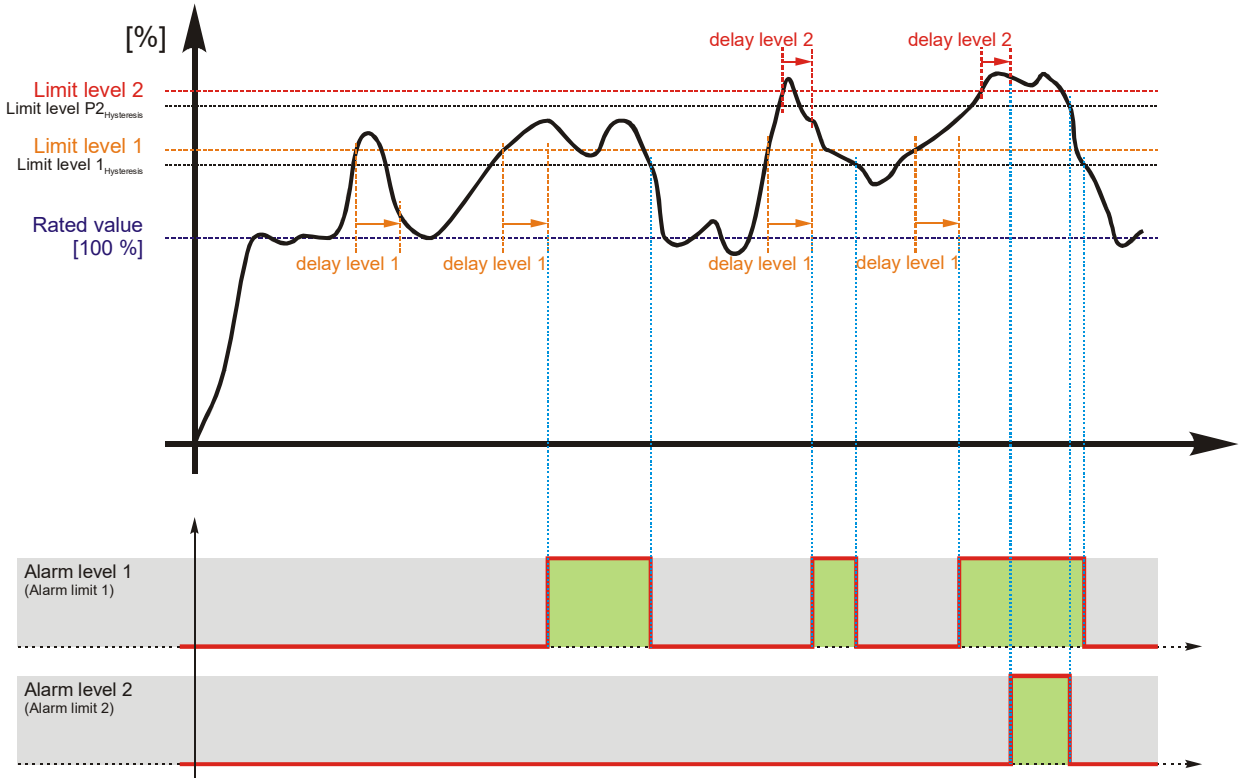

Figure 3-33: Monitoring - battery overvoltage

Parameter table

The parameters represented in this table are specified in the following, whereas the description is identical for all levels; the levels may only differ in their setting ranges.

#1..If the transfer switch type (parameter 3424) is configured to "Standard", this DI may be used as control input (*LogicsManager*)

Table 3-7: Discrete inputs - assignment

Discrete inputs may be configured to normally open (N.O.) or normally closed (N.C.) states. In the state N.O., no potential is present during normal operation; if a control operation is performed, the input is energized. In the state N.C., a potential is continuously present during normal operation; if a control operation is performed, the input is de-energized.

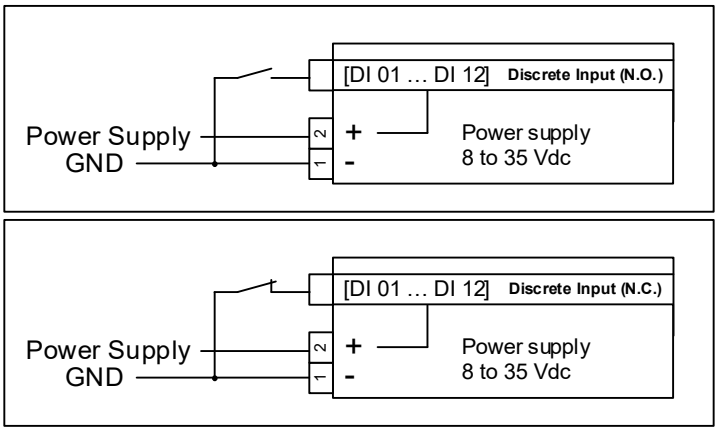

Figure 3-35: Discrete inputs - control inputs - operation logic

NOTE

The discrete inputs for the breaker position reply messages (DIs 1 through 4) are fixed to N.C. and are evaluated as N.C., i.e. the breaker is considered as "in position" if the respective DI is de-energized.

EN DI {x} operation
DE DI {x} Funktion
CL2 1281 {0} ✓ {1} ✓ {2} ✓

Discrete input: Operation **N.O. / N.C.**

The discrete inputs may be operated by an normally open (N.O.) or normally closed (N.C.) contact. The idle circuit current input can be used to monitor for a wire break. A positive or negative voltage polarity referred to the reference point of the DI may be applied.

N.O...... The discrete input is analyzed as "enabled" by energizing the input (normally open).

N.C...... The discrete input is analyzed as "enabled" by de-energizing the input (normally closed).

EN DI {x} delay
DE DI {x} Verzögerung
CL2 1280 {0} ✓ {1} ✓ {2} ✓

Discrete input: Delay **0.08 to 650.00 s**

A delay time in seconds can be assigned to each alarm or control input. The discrete input must be enabled without interruption for the delay time before the unit reacts. If the discrete input is used within the *LogicsManager* this delay is taken into account as well.

The preceding parameters are used to configure the discrete inputs 5 through 12. The parameter IDs refer to DI 5. Refer to Table 3-8 for the parameter IDs of the parameters DI 6 through DI 12. The DIs 1 through 4 are fixed for breaker position feedback signals to the settings, which are indicated in the List Of Parameters starting on page 148 and cannot be configured. However, they may still be used for other purposes if the breaker position feedback signals are not used.

Counters

Configure Counters: Operation Hours, kWh, and kvarh

EN Counter value preset
DE Zähler-Setzwert
CL2 2515 {0} ✓ {1} ✓ {2} ✓

Counter: Set point value for counters **0 to 99,999,999**

This value is utilized to set the hours in the following parameters:
- kWh counter
- kvarh counter

The number entered into this parameter is the number that will be set to the parameters listed above when they are enabled.

EN S1 active power [0.00MWh]
DE S1 Wirkarbeit [0,00MWh]
CL2 2514 {0} ✓ {1} ✓ {2} ✓

Counter: Set Source 1 kWh counter **YES / NO**

YES..... The current value of this counter is overwritten with the value configured in "set point value for counters". After the counter has been (re)set, this parameter changes back to "NO" automatically.
NO ..... The value of this counter is not changed.

EN S1 react. power [0.00Mvarh]
DE S1 Blindarbeit [0,00Mvarh]
CL2 2516 {0} ✓ {1} ✓ {2} ✓

Counter: Set Source 1 kvarh counter **YES / NO**

YES..... The current value of this counter is overwritten with the value configured in "set point value for counters". After the counter has been (re)set, this parameter changes back to "NO" automatically.
NO ..... The value of this counter is not changed.

EN Transfers to S1
DE Transfers nach S1
CL2 2576 {0} ✓ {1} ✓ {2} ✓

Counter: Transfers to S1 **0 to 65535**

This parameter is used to configure the transfer counters to a pre-set value, or reset it to “0” in case a new transfer switch has been build into the ATS cabinet.

The counter for “Transfers to S1” counts, how often the ATS switch has been closed to the Source 1 position.

EN S2 active power [0.00MWh]
DE S2 Wirkarbeit [0,00MWh]
CL2 2510 {0} ✓ {1} ✓ {2} ✓

Counter: Set Source 2 kWh counter **YES / NO**

YES..... The current value of this counter is overwritten with the value configured in "set point value for counters". After the counter has been (re)set, this parameter changes back to "NO" automatically.
NO ..... The value of this counter is not changed.

EN S2 react. power [0.00Mvarh]
DE S2 Blindarbeit [0,00Mvarh]
CL2 2511 {0} ✓ {1} ✓ {2} ✓

Counter: Set Source 2 kvarh counter **YES / NO**

YES..... The current value of this counter is overwritten with the value configured in "set point value for counters". After the counter has been (re)set, this parameter changes back to "NO" automatically.
NO ..... The value of this counter is not changed.

EN				Transfers to S2
DE				Transfers nach S2
CL2	{0}	{1}	{2}	
2577	✓	✓	✓	

Counter: Transfers to S2 **0 to 65535**

This parameter is used to configure the transfer counters to a pre-set value, or reset it to “0” in case a new transfer switch has been build into the ATS cabinet.

The counter for “Transfers to S2” counts, how often the ATS switch has been closed to the Source 2 position.

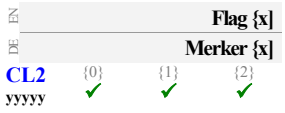
NOTE

Example: The counter value preset (parameter 2515 on page 104) is configured to "3456".
If parameter 2510 will be configured to YES, the S2 active power counter will be set to 34.56MWh.

LogicsManager

LogicsManager: Internal Flags

Internal flags within the *LogicsManager* logical outputs may be programmed and used for multiple functions. For conditions and explanation of programming please refer to page 125 in chapter "*LogicsManager*").



Internal flags: Flag {x} [x = 1 to 8] *LogicsManager*

The flags may be used as auxiliary flags for complex combinations by using the logical output of these flags as command variable for other logical outputs.

Parameter ID yyyyy	Flag {x}
12230	Flag 1
12240	Flag 2
12250	Flag 3
12260	Flag 4
12270	Flag 5
12280	Flag 6
12290	Flag 7
12300	Flag 8

Table 3-13: Internal flags - parameter IDs

NOTE

Flag 1 is also used as placeholder in other logical combinations. Flag 8 is preset with a timer start.

LogicsManager: Timer

LogicsManager: Daily Time Set Point

Utilizing the *LogicsManager* it is possible to establish specific times of the day that functions (i.e. generator exerciser) can be enabled. The two daily time set points are activated each day at the configured time. Using the *LogicsManager* these set points may be configured individually or combined to create a time range.

EN Setpoint {x}: Hour
DE Setpoint {x}: Stunde
CL2 1652 1657 {0} ✓ {1} ✓ {2} ✓

Timer: Daily time set point {x} [x = 1/2]: hour **0 to 23 h**

Enter the hour of the daily time set point here. Example:
0..... 0th hour of the day (midnight).
23..... 23rd hour of the day (11pm).

EN Setpoint {x}: Minute
DE Setpoint {x}: Minute
CL2 1651 1656 {0} ✓ {1} ✓ {2} ✓

Interfaces

NOTE

Please refer to the Interface Manual 37943 for a detailed description of the interface parameters.

EN Device number
DE Gerätenummer
CL2 {0} {1} {2}
1702 ✓ ✓ ✓

Interfaces: Device address **1 to 127**

So that this control unit may be positively identified on the CAN bus, the unit address must be set in this parameter. The address may only be represented once on the CAN bus. All other addresses on the CAN bus are calculated on the basis of the address entered in this parameter.

Interfaces: CAN Bus (*FlexCAN*)

NOTE

The CAN bus is a field bus and subject to various disturbances. Therefore, it cannot be guaranteed that every request will be answered. We recommend repeating a request, which is not answered within reasonable time.

EN Baudrate
DE Baudrate
CL2 {0} {1} {2}
3156 ✓ ✓ ✓

CAN bus: Baud rate **20 / 50 / 100 / 125 / 250 / 500 / 800 / 1,000 kBaud**

This parameter defines the used Baud rate. Please note, that all participants on the CAN bus must use the same Baud rate.

NOTE

The CAN bus in the DTSC-200A is not able to support the Baud rate 800kBaud. Additionally, the Baud rate 20kB could be as well critical because the amount of transferred data are maybe not fast enough refreshed.

Interfaces: CAN BUS: CANopen

EN CAN-Open Master
DE CAN-open Master
CL2 9000 {0} ✓ {1} ✓ {2} ✓

CANopen Master **YES / NO**

YES .....The DTSC-200A is the CANopen Master.
The unit automatically changes into operational mode and transmits Remote Start messages since Broadcast
Attached external devices were configured from the unit with SDO messages. The unit sends a SYNC message all 20ms on COB ID 80 Hex.
NO .....The DTSC-200A is a CANopen Slave.

EN Producer heartbeat time
DE Producer heartbeat time
CL2 9120 {0} ✓ {1} ✓ {2} ✓

CAN bus: Producer heartbeat time **20 to 65,530 ms**

Independent from the CANopen Master configuration, the unit transmits a heartbeat message with this configured heartbeat cycle time. If the producer heartbeat time is equal 0, the heartbeat will only be sent as response to a remote frame request. The time configured here will be rounded up to the next 20 ms step.

EN COB-ID SYNC Message
DE COB-ID SYNC Message
CL2 9100 {0} ✓ {1} ✓ {2} ✓

COB-ID SYNC Message **1 to FFFFFFFF**

This parameter defines whether the unit generates the SYNC message or not.

Complies with CANopen specification: object 1005, subindex 0; defines the COB ID of the synchronization object (SYNC). The structure of this object is shown in the following tables:

UNSIGNED 32		MSB				LSB
bits	bits	31	30	29	28-11	10-0
11 bit ID	11 bit ID	X	0/1	X	00000000000000000	11 bit identifier

bit number	value	meaning
31 (MSB)	X	N/A
30	0 1	Unit does not generate SYNC message Unit generates SYNC message
29	X	N/A
28-11	0	always
10-0 (LSB)	X	bits 10-0 of SYNC COB ID

EN Configure external devices
DE Externe Geräte konfigurieren
CL2 15134 {0} ✓ {1} ✓ {2} ✓

Configure external devices **YES / NO**

This parameter starts the configuration of external Phoenix expansion boards.

Proceed as follows to configure an external device:
- Connect external device
- Configure parameters at the DTSC (Node ID, DI/Os, AI/Os)
- Set this parameter to “Yes”
- Verify the successful configuration of the external device

Note: This parameter can only be used to configure a Phoenix expansion board. Refer to the IKD 1 manual 37135 for configuring the IKD 1 expansion boards.

Interfaces: CAN BUS: CANopen: Additional Server SDOs

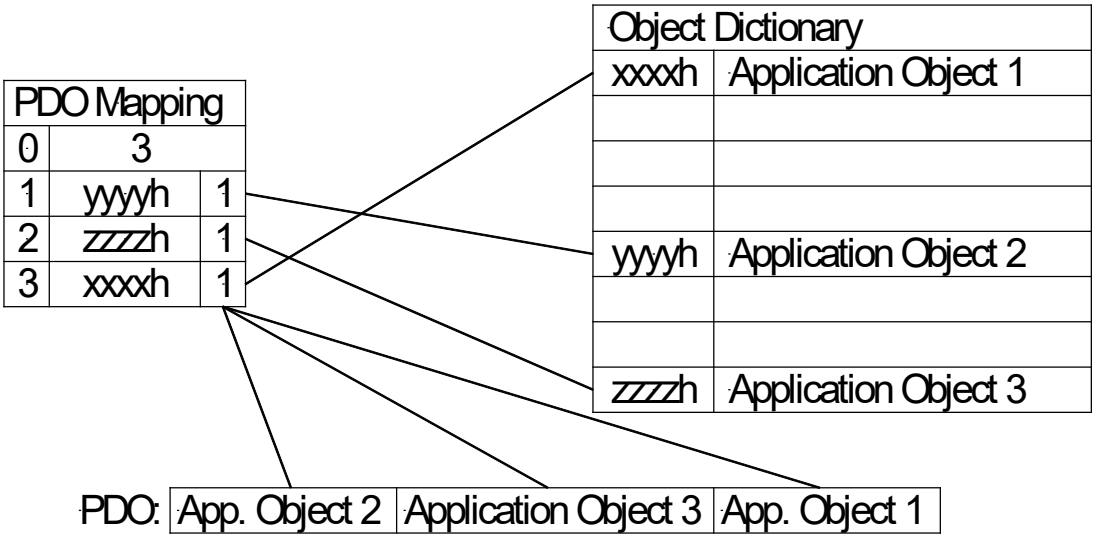

Figure 3-36: Interfaces - Principle of PDO mapping

EN COB-ID
DE COB-ID
CL2 {0} {1} {2}
9300 ✓ ✓ ✓
9310

Receive PDO 1/2 - COB-ID **1 to FFFFFFFF**

This parameter contains the communication parameters for the PDOs, the device is able to receive.

Complies with CANopen specification: object 1400 (for RPDO 1 and 1401 for RPDO 2), subindex 1. The structure of this object is shown in the following tables:

UNSIGNED 32	MSB				LSB
bits	31	30	29	28-11	10-0
11 bit ID	0/1	X	X	00000000000000000	11 bit identifier

bit number	value	meaning
31 (MSB)	0 1	PDO exists / is valid PDO does not exist / is not valid
30	X	N/A
29	X	N/A
28-11	0	always
10-0 (LSB)	X	bits 10-0 of COB ID

PDO valid / not valid allows selecting, which PDOs are used in the operational state.

CAUTION

The COB-IDs have to be configured different, even if one RPDO is configured to "no func.".

EN Function
DE Funktion
CL2 {0} {1} {2}
9050 ✓ ✓ ✓
9051

Function for RPDO 1/2 **no func. / 1st IKD /2nd IKD / Bk 16DIDO**

The unit provides pre-configured CAN bus settings for the connection of different units. The unit to be connected must be selected here.

No func. ..... No external unit is selected for connection. The CAN bus is disabled. Values are not sent or received.
1st IKD ..... The unit is pre-configured for the connection of a Woodward IKD 1 expansion board.
2nd IKD ..... The unit is pre-configured for the connection of a second Woodward IKD 1 expansion board.
BK 16 DIDO The unit is pre-configured for the connection of a Phoenix Contact BK 16 DIDO expansion board.

The following table shows several possible functional combinations:

PDO1 / PDO2	1st IKD	2nd IKD	OFF
1st IKD	NO	YES	YES
2nd IKD	YES	NO	YES
Bk 16DIDO	NO	NO	YES
no func.	YES	YES	YES

Read: If PDO1 is configured as 1. IKD, then PDO2 can only be configured as either 2. IKD or "no func.".

EN Node-ID of the device
DE Node-ID des Gerätes
CL2 {0} {1} {2}
9060 ✓ ✓ ✓
9061

Node-ID of the device **1 to 127**

Node-ID of the attached device. The SDO messages were sent on the standard SDO-IDs or the answers were expected.

EN RPDO-COP-ID ext. device {x}
DE RPDO-COP-ID ext. Gerät {x}

CL2	{0}	{1}	{2}
9070	✓	✓	✓
9072			

RPDO-COB-ID ext. device 1 **1 to FFFFFFFF**

Value to be written in the object 1800h sub index 1h of the external device.

CAUTION

COB-IDs already used in other PDOs should be used.

COB-IDs in a CANopen device after loading the standard values:
280h + Node-ID = 640 + Node-ID Object 1801h Subindex 1
380h + Node-ID = 896 + Node-ID Object 1802h Subindex 1
480h + Node-ID = 1152 + Node-ID Object 1803h Subindex 1

The receiving COB-IDs are preallocated:
300h + Node-ID = 768 + Node-ID Object 1401h Subindex 1
400h + Node-ID = 1024 + Node-ID Object 1402h Subindex 1
500h + Node-ID = 1280 + Node-ID Object 1403h Subindex 1.

Problems may be encountered if a COB-ID is assigned multiple times.

Interfaces: CAN Bus: CANopen: Transmit PDO (TPDO) {x} ({x} = 1 to 4)

EN COB-ID
DE COB-ID

CL2	{0}	{1}	{2}
9600	✓	✓	✓
9610			
9620			
9630			

CAN bus 1: Transmit PDO 1 - COB ID **1 to FFFFFFFF**

This parameter contains the communication parameters for the PDOs the unit is able to transmit. The unit transmits data (i.e. visualization data) on the CAN ID configured here.

Complies with CANopen specification: object 1800 for (TPDO 1, 1801 for TPDO 2, 1802 for TPDO 3, and 1803 for TPDO 4), subindex 1. The structure of this object is shown in the following tables:

UNSIGNED 32		MSB				LSB
bits	bits	31	30	29	28-11	10-0
11 bit ID	11 bit ID	0/1	X	X	00000000000000000	11 bit identifier

bit number	value	meaning
31 (MSB)	0 1	PDO exists / is valid PDO does not exist / is not valid
30	X	N/A
29	X	N/A
28-11	0	always
10-0 (LSB)	X	bits 10-0 of COB ID

PDO valid / not valid allows selecting, which PDOs are used in the operational state.

EN Transmission type
DE Transmission type

CL2	{0}	{1}	{2}
9602	✓	✓	✓
9612			
9622			
9632			

CAN bus 1: Transmit PDO 1 - Transmission type **0 to 255**

This parameter contains the communication parameters for the PDOs the unit is able to transmit. It defines whether the unit broadcasts all data automatically (value 254 or 255) or only upon request with the configured address of the COB ID SYNC message (parameter 9100).

Complies with CANopen specification: object 1800 (for TPDO 1, 1801 for TPDO 2, 1802 for TPDO 3, and 1803 for TPDO 4), subindex 2. The description of the transmission type is shown in the following table:

transmission type	PDO transmission				
	cyclic	acyclic	synchronous	asynchronous	RTR only
0	will not be sent				
1-240	X		X		
241-251	will not be sent				
252	will not be sent				
253	will not be sent				
254				X	
255				X	

A value between 1 and 240 means that the PDO is transferred synchronously and cyclically. The transmission type indicating the number of SYNC, which is necessary to trigger PDO transmissions. Receive PDOs are always triggered by the following SYNC upon reception of data independent of the transmission types 0 to 240. For TPDOs, transmission type 254 and 255 means, the application event is the event timer.

CAN bus 1: Transmit PDO 1 - 4. Mapped object **0 to 65535**

This parameter contains the information about the mapped application variables. These entries describe the PDO contents by their index. The sub-index is always 1. The length is determined automatically.

Complies with CANopen specification: object 1A00 (for TPDO 1, 1A01 for TPDO 2, 1A02 for TPDO 3, and 1A03 for TPDO 4), subindex 4

NOTE

CANopen allows sending 8 bytes of data with each Transmit PDO. These may be defined separately if no pre-defined data protocol is used.

All data protocol parameters with a parameter ID may be sent as an object with a CANopen Transmit PDO.

In this case, the data length will be taken from the data byte column (refer to the Data Protocols section in the Interface Manual 37943):

- **1,2 UNSIGNED16 or SIGNED16**
- **3,4 UNSIGNED16 or SIGNED16**
- **5,6 UNSIGNED16 or SIGNED16**
- **1,2,3,4 UNSIGNED32 or SIGNED32**
- **3,4,5,6 UNSIGNED32 or SIGNED32**
- **etc.**

The object ID is identical with the parameter ID when configuring via front panel or ToolKit.

Interfaces: USB

NOTE

There is no special setting in the device needed. Please go sure that you have installed the correct USB Windows driver on your PC on which your ToolKit is running.

Interfaces: Serial Interface 2 (RS-485)

If no softkey has been pressed for the time configured here, the display backlight will be disabled.

System: Configure Daylight Saving Time

It is possible to configure the real-time clock for an automatic change to daylight saving time. Start and end date/time of the daylight saving time period have to be entered for this.

Example: If daylight saving time starts at 2:00 am on the 2nd Sunday in March and ends at 2:00 am on the 1st Sunday in November, the unit has to be configured like shown in Table 3-14 to enable an automatic change to daylight saving time and back to standard time.

ID	Parameter	Setting
4591	Daylight saving time	On
4594	DST begin time	2
4598	DST begin weekday	Sunday
4592	DST begin nth weekday	2nd
4593	DST begin month	3
4597	DST end time	2
4599	DST end weekday	Sunday
4595	DST end sunday	1st
4596	DST end month	11

Table 3-14: Daylight saving time - configuration example

	USA, Canada		European Union	
Year	DST Begins 2 a.m. (Second Sunday in March)	DST Ends 2 a.m. (First Sunday in November)	DST Begins 1 a.m. UTC=GMT (Last Sunday in March)	DST Ends 1 a.m. UTC=GMT (Last Sunday in October)
2008	March 9, 2008	November 2, 2008	March 30, 2008	October 26, 2008
2009	March 8, 2009	November 1, 2009	March 29, 2009	October 25, 2009
2010	March 14, 2010	November 7, 2008	March 28, 2010	October 31, 2010

Table 3-15: Daylight saving time - examplary dates

EN Daylight saving time
DE Sommer-Winterzeit Erkennung

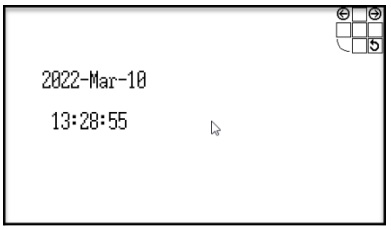
NO .....The factory settings will not be loaded by the unit.

System: Real-Time Clock Set



This screen shows the current date and time. The clock is implemented as real time clock. In case of a voltage supply failure an internal battery guarantees that the information is not lost. The data stand for:

XX:YY:ZZ..... hour:minute:second.
AAAA-BBB-CC..... Year-month-day.

System: Adjust Clock

EN Hour
DE Stunden
CL2 1710 {0} ✓ {1} ✓ {2} ✓

Adjust clock: hour **0 to 23 h**

The current hour of the clock time is set here. Example:
0..... 0th hour of the day.
23..... 23th hour of the day.

EN Minute
DE Minuten
CL2 1709 {0} ✓ {1} ✓ {2} ✓

Adjust clock: minute **0 to 59 min**

The current minute of the clock time is set here. Example:
0..... 0th minute of the hour.
59..... 59th minute of the hour.

EN Second
DE Sekunden
CL2 1708 {0} ✓ {1} ✓ {2} ✓

Adjust clock: second **0 to 59 s**

The current second of the clock time is set here. Example:
0..... 0th second of the minute.
59..... 59th second of the minute.

EN Transfer time to clock
DE Zeit in Uhr übernehmen
CL2 1698 {0} ✓ {1} ✓ {2} ✓

Adjust clock: transfer time to clock **YES / NO**

YES..... Adjusted time will be transferred to the unit.
NO..... Adjusted time will be not transferred to the unit.

System: Adjust Date

EN Day
DE Tag
CL2 1711 {0} ✓ {1} ✓ {2} ✓

Adjust clock: day **1 to 31**

The current day of the date is set here. Example:
1..... 1st day of the month.
31..... 31st day of the month.

EN Month
DE Monat
CL2 1712 {0} ✓ {1} ✓ {2} ✓

Adjust clock: month **1 to 12**

The current month of the date is set here. Example:
1..... 1st month of the year.
12..... 12th month of the year.

EN Year
DE Jahr
CL2 1713 {0} ✓ {1} ✓ {2} ✓

Adjust clock: year **0 to 99**

The current year of the date is set here. Example:
0..... Year 2000.
99..... Year 2099.

EN Transfer date to clock
DE Datum in Uhr übernehmen
CL2 1699 {0} ✓ {1} ✓ {2} ✓

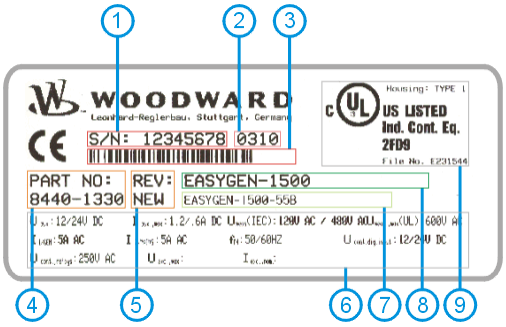
Adjust clock: transfer date to clock **YES / NO**

YES..... Adjusted date will be transferred to the unit.
NO..... Adjusted date will be not transferred to the unit.

System: Versions

The parameters in this section are informational only and cannot be modified.

The control unit may be identified from the numbers located on the unit and in the software. The most important technical information is located on the unit data plate. Technical data can be located in manual 37939.



1	S/N	serial number (numeric)
2	S/N	manufactured date (YYMM)
3	S/N	serial number (as Barcode)
4	P/N	part number
5	REV	part number revision
6	Details	technical data
7	Type	description (long)
8	Type	Description (short)
9	UL	UL sign

EN Serial number
DE Seriennummer
900 {0} ✓ {1} ✓ {2} ✓

Version: Serial number (S/N) **info**

The serial number (S/N) is utilized to identify individual control units. The number can also be found on the data plate (items #**1** & #**3**).

EN Boot item number
DE Boot Artikelnummer
950 {0} ✓ {1} ✓ {2} ✓

Version: Part number of the firmware (P/N) **info**

The part number (P/N) is the firmware in the control unit.

EN Boot revision
DE Boot Revision
960 {0} ✓ {1} ✓ {2} ✓

Version: Revision of the item number of the firmware (REV) **info**

The revision number (REV) is the revision of the control unit firmware.

EN Boot version
DE Boot Version
965 {0} ✓ {1} ✓ {2} ✓

Version: Version of the firmware **info**

This number (Vx.xxxx) represents the version of the control unit firmware.

EN Program item number
DE Programm Artikelnummer
930 {0} ✓ {1} ✓ {2} ✓

Version: Item number of the application software (P/N) **info**

The part number (P/N) is the application software running the control unit.

EN Program revision
DE Programm Revision
940 {0} ✓ {1} ✓ {2} ✓

Version: Revision of the item number of the software (REV) **info**

The revision number (REV) is the revision of the application software running the control unit.

EN Program version
DE Programm Version
945 {0} ✓ {1} ✓ {2} ✓

Version: Version of the application software **info**

This number (Vx.xxxx) represents the version of the application software running the control unit.

Appendix A.
LogicsManager

The *LogicsManager* is used to customize the sequence of events in the control **unit** such as the start command of the engine or the operation of control unit relay outputs. For example, the start routine may be programmed so that it requires the closing of a discrete input or a preset time of day. Two independent time delays are provided for the configured action to take place and be reset. The following table shows the function of each relay in each of the application modes.

Starting the engine can be carried out externally via a discrete input. With it the *LogicsManager* is used whose conditions and programming is defined as follows.

Table 3-10 on page 102 shows the assignment of different functions to various discrete outputs.

Structure and description of the *LogicsManager*

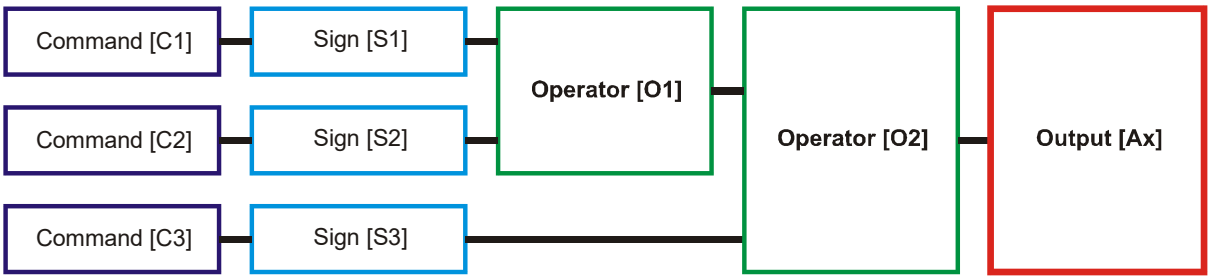


Figure 3-37: *LogicsManager* - function overview

- **Command (variable)** - A list of over 100 parameters and functions is provided for the command inputs. Examples of the parameters that may be configured into these commands are Source 1 undervoltage, Start fail, and Cool down. These command variables are used to control the output function or relay. Refer to Logical Command Variables starting on page 130 for a complete list of all command variables.
- **Sign** - The sign field can be used to invert the state of the command or to fix its output to a logical true or false if the command is not needed. Setting the sign to the NOT state changes the output of the command variable from true to false or vise versa.
- **Operator** - A logical device such as AND or OR.
- **(Logical) output** - The action or control sequence that occurs when all parameters set into the *LogicsManager* are met.

[Cx] - Command {x}	[Sx] - Sign {x}	[Ox] - Operator {x}	[Ax] - Output {x}
The description and the tables of all values, flags, and internal functions that are able to combine via the *LogicsManager* can be found in the Logical Command Variables section starting on page 130.	**Value {[Cx]}** The value [Cx] is passed 1:1. **NOT Value {[Cx]}** The opposite of the value [Cx] is passed. **0 [False; always "0"]** The value [Cx] is ignored and this logic path will always be FALSE. **1 [True; always "1"]** The value [Cx] is ignored and this logic path will always be TRUE.	**AND** Logical AND **NAND** Logical negated AND **OR** Logical OR **NOR** Logical negated OR **XOR** Exclusive OR **NXOR** Exclusive negated OR (See Table 3-17 for symbols)	The description and the tables of all logical outputs, flags, and functions that are able to combine via the *LogicsManager* can be found in the Logical Outputs section starting on page 128.

Table 3-16: *LogicsManager* - command overview

NOTE

A logical output may either be delayed when switching on or switching off. The time starts when all logical functions of the operation have been met.

Configuration of the chain of commands

Using the values specified in the above table, the chain of commands of the *LogicsManager* (for example: operating the relays, setting the flags, specification of the automatic functions) is configured as follows:

[Ax] = (([C1] & [S1]) & [O1] & ([C2] & [S2])) & [O2] & ([C3] & [S3])

Programming example for the *LogicsManager*:
Flag 8 shall become TRUE, whenever "Setpoint 1" is TRUE "AND" "Setpoint 2" is "NOT" TRUE "AND" the "Active week day" is TRUE ⇨

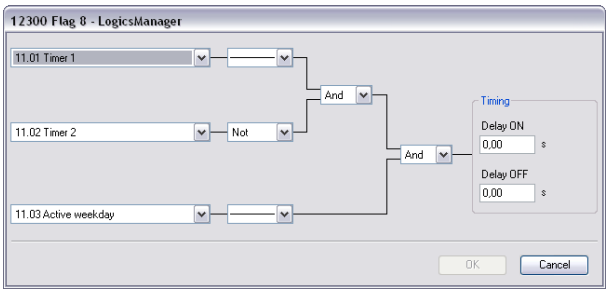

Figure 3-38: *LogicsManager* - display in ToolKit

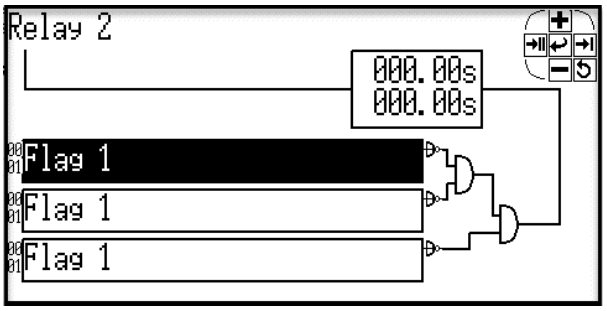

Figure 3-39: *LogicsManager* - display in LCD

Logical Symbols

The following symbols are used for the graphical programming of the *LogicsManager*.

	AND	OR	NAND	NOR	NXOR	XOR
DTSC						DIN 40 700						ASA US MIL						
IEC617-12						
Truth table	x1	x2	y	x1	x2	y	x1	x2	y	x1	x2	y	x1	x2	y	x1	x2	y
	0	0	0	0	0	0	0	0	1	0	0	1	0	0	1	0	0	0
	0	1	0	0	1	1	0	1	1	0	1	0	0	1	0	0	1	1
	1	0	0	1	0	1	1	0	1	1	0	0	1	0	0	1	0	1
	1	1	1	1	1	1	1	1	0	1	1	0	1	1	1	1	1	0

Table 3-17: *LogicsManager* - logical symbols

Logical Outputs

The logical outputs or combinations may be grouped into three categories:

- internal logical flags
- Internal functions
- relay outputs

NOTE

The numbers of the logical outputs in the third column may again be used as input variable for other outputs in the *LogicsManager*.

Logical Outputs: Internal Flags

8 internal logical flags may be programmed to activate/deactivate functions. This permits more than 3 commands to be included in a logical function. The may be used as "auxiliary flags".

Name	Function	Number
Flag 1	Internal flag 1	00.01
Flag 2	Internal flag 2	00.02
Flag 3	Internal flag 3	00.03
Flag 4	Internal flag 4	00.04
Flag 5	Internal flag 5	00.05
Flag 6	Internal flag 6	00.06
Flag 7	Internal flag 7	00.07
Flag 8	Internal flag 8	00.08

Logical Outputs: Internal functions

The following logical functions may be used to activate/deactivate functions.

Name	Function	Number
External acknowledge	The alarm acknowledgement is performed from an external source (refer to parameter 12490 on page 70)	00.15

Logical Outputs: Relay Outputs

All relays may be controlled directly by the *LogicsManager* depending on the respective application mode.

Name	Function	Number
Relay 1	**Does not exist !**	13.01
Relay 2	If this logical output becomes true, the relay output 2 will be activated	13.02
Relay 3	If this logical output becomes true, the relay output 3 will be activated	13.03
Relay 4	If this logical output becomes true, the relay output 4 will be activated	13.04
Relay 5	If this logical output becomes true, the relay output 5 will be activated	13.05
Relay 6	If this logical output becomes true, the relay output 6 will be activated	13.06
Relay 7	If this logical output becomes true, the relay output 7 will be activated	13.07
Relay 8	If this logical output becomes true, the relay output 8 will be activated	13.08
Relay 9	If this logical output becomes true, the relay output 9 will be activated	13.09
External DO 1	If this logical output becomes true, the external relay output 1 will be activated	14.01
External DO 2	If this logical output becomes true, the external relay output 2 will be activated	14.02
External DO 3	If this logical output becomes true, the external relay output 3 will be activated	14.03
External DO 4	If this logical output becomes true, the external relay output 4 will be activated	14.04
External DO 5	If this logical output becomes true, the external relay output 5 will be activated	14.05
External DO 6	If this logical output becomes true, the external relay output 6 will be activated	14.06
External DO 7	If this logical output becomes true, the external relay output 7 will be activated	14.07
External DO 8	If this logical output becomes true, the external relay output 8 will be activated	14.08
External DO 9	If this logical output becomes true, the external relay output 9 will be activated	14.09
External DO 10	If this logical output becomes true, the external relay output 10 will be activated	14.10
External DO 11	If this logical output becomes true, the external relay output 11 will be activated	14.11
External DO 12	If this logical output becomes true, the external relay output 12 will be activated	14.12
External DO 13	If this logical output becomes true, the external relay output 13 will be activated	14.13
External DO 14	If this logical output becomes true, the external relay output 14 will be activated	14.14
External DO 15	If this logical output becomes true, the external relay output 15 will be activated	14.15
External DO 16	If this logical output becomes true, the external relay output 16 will be activated	14.16

Logical Command Variables

The logical command variables are grouped into 14 categories:

- [00.00] Internal flags
- [01.00] Alarm classes
- [03.00] Engine control
- [04.00] Operating status
- [05.00] Alarms of the engine
- [06.00] Load alarms
- [08.00] System alarms
- [09.00] Discrete inputs
- [11.00] Time functions
- [12.00] External discrete inputs
- [13.00] Internal relay output status
- [14.00] External relay outputs status
- [19.00] ATS status flags
- [20.00] ATS status flags

Logical Command Variables: [00.00] - Internal Flags

Internal flag, Logic command variables 00.01-00.20
Internal Flags are the result of the output of the logic ladders from Flag 1 to 8. Flags are internal logic that can be sent to other flags or Command variables.

No.	Name	Function	Note
00.01	Flag 1	Internal flag 1	Internal calculation; page 128
00.02	Flag 2	Internal flag 2	Internal calculation; page 128
00.03	Flag 3	Internal flag 3	Internal calculation; page 128
00.04	Flag 4	Internal flag 4	Internal calculation; page 128
00.05	Flag 5	Internal flag 5	Internal calculation; page 128
00.06	Flag 6	Internal flag 6	Internal calculation; page 128
00.07	Flag 7	Internal flag 7	Internal calculation; page 128
00.08	Flag 8	Internal flag 8	Internal calculation; page 128
00.09	-	-	not used
00.10	-	-	not used
00.11	-	-	not used
00.12	-	-	not used
00.13	-	-	not used
00.14	-	-	not used
00.15	External acknowledge	The alarm acknowledgement is performed from an external source	Internal calculation; page 70
00.16	Operation mode AUTO	-	not used
00.18	-	-	not used
00.19	-	-	not used
00.20	-	-	not used

Logical Command Variables: [01.00] - Alarm Classes

Alarm class commands, Logic command variables 01.01-01.10
Alarm classes may be configured as command variables for all logical outputs in the *LogicsManager*.

Number	Name / Function	Note
-	-	not used
-	-	not used
-	-	not used
-	-	not used
-	-	not used
-	-	not used
-	-	not used
-	-	not used
-	-	not used
01.10	Centralized alarm	TRUE when a monitoring function raises an alarm.

Logical Command Variables: [03.00] - Engine Control

Engine control commands, Logic command variables 03.01-03.14
These variables may be used as command variable in a logical output to set parameters for customized operations.

Number	Name / Function	Note
03.01	-	not used
03.02	-	not used
03.03	-	not used
03.04	-	not used
03.05	Horn (active)	TRUE if alarm class B to F is activated until the time until horn reset is expired or it is acknowledged for the first time.
03.06	-	not used
03.07	-	not used
03.08	-	not used
03.09	-	not used

Logical Command Variables: [08.00] - System Alarms

System alarms status commands, 08.01-08.10

These system alarms may be used as command variables in a logical output n to set parameters for customized operations.

Number	Function	Note
08.01	Battery overvoltage (limit) 1	TRUE = limit value reached FALSE = alarm acknowledged
08.02	Battery overvoltage (limit) 2	
08.03	Battery undervoltage (limit) 1	
08.04	Battery undervoltage (limit) 2

Logical Command Variables: [09.00] - Discrete Inputs

Control discrete input commands, 09.01-09.08

The discrete inputs may be used as command variables in a logical output to set parameters for customized operations.

Number	Function	Note
09.01	DI 1 (Discrete input [D1])	In comparison to the other discrete inputs both flags are inverted to its physical condition. That means if the breaker is in closed position the flag is TRUE and if the breaker is not in closed position the flag is FALSE. *This makes the configuration over LM logical easier to handle.*
09.02	DI 2 (Discrete input [D2])	
09.03	DI 3 (Discrete input [D3])	TRUE = logical "1" (delay times and NO/NC parameters are ignored) FALSE = logical "0" (alarm has been acknowledged or immediately after TRUE condition is no longer present , if the Control is configured as alarm class)
09.04	DI 4 (Discrete input [D4])	
09.05	DI 5 (Discrete input [D5])	
09.06	DI 6 (Discrete input [D6])	
09.07	DI 7 (Discrete input [D7])	
09.08	DI 8 (Discrete input [D8])	
09.09	DI 9 (Discrete input [D9])	
09.10	DI 10 (Discrete input [D10])	
09.11	DI 11 (Discrete input [D11])	
09.12	DI 12 (Discrete input [D12])

Logical Command Variables: [11.00] - Time Functions

Time function commands, 11.01-11.10
Time functions may be used as command variables in a logical output.

Number	Name / Function	Note
11.01	Timer 1 (exceeded)	see page 107
11.02	Timer 2 (exceeded)	see page 107
11.03	Active weekday (equal to setting)	see page 107
11.04	Active day (equal to setting)	see page 107
11.05	Active hour (equal to setting)	see page 107
11.06	Active minute (equal to setting)	see page 107
11.07	Active second (equal to setting)	see page 107
11.08	-	not used

Logical Command Variables: [12.00] - External Discrete Inputs (Expansion Board)

External discrete input commands, 12.01-12.16
Additional discrete inputs from an expansion board (i.e. IKD 1 extension board) may be used as command variables in a logical output.

Number	Name / Function	Note
12.01	External discrete input 1 [D.E01]	TRUE = logical "1" (delay times and NO/NC parameters are ignored) FALSE = logical "0" (alarm has been acknowledged, or immediately after TRUE condition is no longer present, if the Control is configured as alarm class)
12.02	External discrete input 2 [D.E02]	
12.03	External discrete input 3 [D.E03]	
12.04	External discrete input 4 [D.E04]	
12.05	External discrete input 5 [D.E05]	
12.06	External discrete input 6 [D.E06]	
12.07	External discrete input 7 [D.E07]	
12.08	External discrete input 8 [D.E08]	
12.09	External discrete input 9 [D.E09]	
12.10	External discrete input 10 [D.E10]	
12.11	External discrete input 11 [D.E11]	
12.12	External discrete input 12 [D.E12]	
12.13	External discrete input 13 [D.E13]	
12.14	External discrete input 14 [D.E14]	
12.15	External discrete input 15 [D.E15]

12.20	-	not used

Logical Command Variables: [13.00] - Internal Relay Output Status

Discrete output commands, 13.01-13.08

The discrete outputs may be used as command variables in a logical output.

Number	Name / Function	Note
13.01	Discrete output DO1 [R01]	TRUE = logical "1" (this condition indicates the logical status of the internal relays) FALSE = logical "0" (this condition indicates the logical status of the internal relays)
13.02	Discrete output DO2 [R02]	
13.03	Discrete output DO3 [R03]	
13.04	Discrete output DO4 [R04]	
13.05	Discrete output DO5 [R05]	
13.06	Discrete output DO6 [R06]	
13.07	Discrete output DO7 [R07]	
13.08	Discrete output DO8 [R08]	
13.09	Discrete output DO9 [R09]

13.20	-	not used

Logical Command Variables: [14.00] - External Relay Outputs Status

Discrete output commands, 14.01-14.16

The external discrete outputs may be used as command variables in a logical output.

Number	Name / Function	Note
14.01	External discrete output DO1 [R01]	TRUE = logical "1" (this condition indicates the logical status of the relays, which are connected via external expansion boards) FALSE = logical "0" (this condition indicates the logical status of the relays, which are connected via external expansion boards)
14.02	External discrete output DO2 [R02]	
14.03	External discrete output DO3 [R03]	
14.04	External discrete output DO4 [R04]	
14.05	External discrete output DO5 [R05]	
14.06	External discrete output DO6 [R06]	
14.07	External discrete output DO7 [R07]	
14.08	External discrete output DO8 [R08]	
14.09	External discrete output DO9 [R09]	
14.10	External discrete output DO10 [R10]	
14.11	External discrete output DO11 [R11]	
14.12	External discrete output DO12 [R12]	
14.13	External discrete output DO13 [R13]	
14.14	External discrete output DO14 [R14]	
14.15	External discrete output DO15 [R15]	
14.16	External discrete output DO16 [R16]	
14.17	-	not used
14.18	-	not used
14.19	-	not used
14.20	-	not used

Logical Command Variables: [19.00] - ATS Status Flags

ATS status flags, 19.01-19.20

The external discrete outputs may be used as command variables in a logical output.

No.	Name / Function	Note
19.01	Source 1 OK (voltage and frequency are in range)	
19.02	Source 1 voltage OK (in range)	
19.03	Source 1 overvoltage (“fail” level exceeded)	
19.04	Source 1 undervoltage (“fail” level exceeded)	
19.05	Source 1 frequency OK (in range)	
19.06	Source 1 overfrequency (“fail” level exceeded)	
19.07	Source 1 underfrequency (“fail” level exceeded)	
19.08	Source 1 voltage imbalance (“fail” level exceeded)	
19.09	Source 1 rotation (field =) CCW	
19.10	Source 1 rotation (field =) CW	
19.11	Source 2 OK (voltage and frequency are in range)	
19.12	Source 2 voltage OK (in range)	
19.13	Source 2 overvoltage (“fail” level exceeded)	
19.14	Source 2 undervoltage (“fail” level exceeded)	
19.15	Source 2 frequency OK (in range)	
19.16	Source 2 overfrequency (“fail” level exceeded)	
19.17	Source 2 underfrequency (“fail” level exceeded)	
19.18	Source 2 voltage imbalance (“fail” level exceeded)	
19.19	Source 2 rotation (field =) CCW	
19.20	Source 2 rotation (field =) CW	
19.21	S1 failed status	
19.22	S2 failed status	

Logical Command Variables: [20.00] - ATS Status Flags 2

ATS status flags, 20.01-20.35

The external discrete outputs may be used as command variables in a logical output.

No.	Name / Function	Note
20.01	Status Flag: Elevator Pre Signal (is active)	
20.02	Status Flag: Motor Load Disconnect (signal is active)	
20.03	Status Flag: Load Test (is) active	
20.04	Status Flag: No Load Test (is) active	
20.05	Status Flag: S1 start signal	
20.06	Status Flag: S2 start signal	
20.07	Command: Close to S1	
20.08	Command: Open from S1	
20.09	Command: Close to S2	
20.10	Command: Open from S2	
20.11	Status Flag: Load shed (is active)	
20.12	Status Flag: Shunt trip enable (is active)	
20.13	Status Flag: S1 closed	TRUE if S1 is closed and S2 is open
20.14	Status Flag: S2 closed	TRUE if S2 is closed and S1 is open
20.15	Status Flag: S1 and S2 open	
20.16	Status Flag: S1 and S2 closed	
20.17	Status Flag: S1 is stabling (at the moment)	
20.18	Status Flag: S2 is stabling (at the moment)	
20.19	Status Flag: Dis. Ext. Sw. Inter. (disable external interlock)	
20.20	Status Flag: Timer exe. Load Test	Load test has automatically been triggered by exercise timer
20.21	Status Flag: Timer exe. No Load	No load test has automatically been triggered by exercise timer
20.22	Sync check active	This flag is set as soon as the DTSC-200A starts to do In-phase monitoring, and resets after the In-Phase transfer to the other source has been accomplished.

20.23	S1: Start delay timer active	Source 1 Start delay timer is running
20.24	S1: Stable timer active	Source 1 Stable timer is running
20.25	S1: Outage timer active	Source 1 Outage timer is running
20.26	S1: Cooldown timer active	Source 1 Cooldown timer is running
20.27	S1: Neutral timer to S2 active	Source 1 Neutral timer to transfer load to source 2 is running
20.28	S2: Start delay timer active	Source 2 Start delay timer is running
20.29	S2: Stable timer active	Source 2 Stable timer is running
20.30	S2: Outage timer active	Source 2 Outage timer is running
20.31	S2: Cooldown timer active	Source 2 Cooldown timer is running
20.32	S2: Neutral timer to S1 active	Source 2 Neutral timer to transfer load to source 1 is running
20.33	Request: Load shed	There is a request presented to shed load
20.34	HMI Load test	The flag is TRUE, if the Load Test button is pushed and the Engine Load test is confirmed (the green LED appears). The flag will be reset if Engine Load Test button is pushed again, and the aborting is confirmed. (The green LED disappears).
20.35	HMI Engine test	The flag is TRUE, if the Engine Test button is pushed and the Engine test is confirmed (the green LED appears). The flag will be reset if Engine Test button is pushed again, and the aborting is confirmed. (The green LED disappears).

Logical Command Variables: [21.00] - ATS Alarms

ATS alarms, 21.01-21.20

The external discrete outputs may be used as command variables in a logical output.

No.	Name / Function	Note
21.01	Engine Alarm: Start fail S1	
21.02	Engine Alarm: Start fail S2	
21.03	Engine Alarm: Unintended Stop S1	
21.04	Engine Alarm: Unintended Stop S2	
21.05	Alarm: S1 phase rotation mismatch (failure present)	
21.06	Alarm: S2 phase rotation mismatch (failure present)	
21.07	Switch alarm: Fail to open (from switch position) S1	
21.08	Switch alarm: Fail to open (from switch position) S2	
21.09	Switch alarm: Fail to close (to switch position) S1	
21.10	Switch alarm: Fail to close (to switch position) S2	
21.11	Switch alarm: Mechanical fail (not plausible limit switch feedbacks have been detected by the DTSC-200A)	Delayed by 3463 ‘Limit switch failure delay time’
21.12	In-Phase monitor alarm: In-phase timeout (the system was not able to establish a "Sync" situation within the configured time)	
21.13	Switch alarm: Overlap timeout (the contacts have been in a "parallel" position for longer than the configured time)	
21.14	Switch alarm: Out of phase XFR-Status	
21.15	Switch alarm Unintended Open S1	
21.16	Switch alarm Unintended Open S2	
21.17	-	not used
21.18	-	not used
21.19	-	not used
21.20	-	not used

Logical Command Variables: [98.00] - *LogicsManager* Outputs

LogicsManager output**s, 98.01-98.20**

The external discrete outputs may be used as command variables in a logical output.

No.	Name / Function	Note
98.01	*LogicsManager* "Inhibit ATS" is TRUE	
98.02	*LogicsManager* "Inhib. XFR to S1" is TRUE	
98.03	*LogicsManager* "Inhib. XFR to S2" is TRUE	
98.04	*LogicsManager* "Remote peak shave" is TRUE	
98.05	*LogicsManager* "Interruptible power rate provisions" is TRUE	
98.06	*LogicsManager* "Gen-Gen enable" is TRUE	
98.07	*LogicsManager* "Delayed mode activation" is TRUE	
98.08	*LogicsManager* "Extended parallel time" is TRUE	
98.09	*LogicsManager* "Load Test" is TRUE	
98.10	*LogicsManager* "No Load Test" is TRUE	
98.11	*LogicsManager* "Source 1 priority" is TRUE	
98.12	*LogicsManager* "Source 2 priority" is TRUE	
98.13	*LogicsManager* "External bypass" is TRUE	
98.14	*LogicsManager* "Load shed" is TRUE	
98.15	*LogicsManager* "Cld tr. enable" is TRUE (enable closed transition)	
98.16	*LogicsManager* "Service disconnect" is TRUE	
98.17	-	not used
98.18	-	not used
98.19	-	not used
98.20	-	not used

Factory Setting

The inputs, outputs, and internal flags, which may be programmed via the *LogicsManager,* have the following factory default settings when delivered:

simple (function)	extended (configuration)	result

Factory Setting: Functions

Inhibit ATS (parameter 12600 on page 39)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, the unit is blocked against automatic transfers. TRUE, if DI 5 is NOT energized		dependent on DI 5

Inhibit XFR to Source 1 (parameter 12610 on page 40)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, the unit is blocked against a transfer to source 1. Prepared for: - Deactivated by default		FALSE

Inhibit XFR to Source 2 (parameter 12620 on page 40)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, the unit is blocked against a transfer to source 2. Prepared for: - Deactivated by default		FALSE

simple (function)		extended (configuration)	result

Remote peak shave (parameter 12630 on page 40)				
{0}	✓	If TRUE, the remote peak shave function will be performed. Prepared for: - Deactivated by default		**FALSE**
{1}	✓			
{2}	✓			

Interruptible power rates (parameter 12660 on page 41)				
{0}	✓	If TRUE, the interruptible power rate provision function will be performed. Prepared for: - Deactivated by default		**FALSE**
{1}	✓			
{2}	✓			

External timer bypass (parameter 12820 on page 41)				
{0}	✓	If TRUE, all timers, which are currently in progress, will be bypassed. Prepared for: - Deactivated by default		**FALSE**
{1}	✓			
{2}	✓			

Gen-Gen enable (parameter 12830 on page 42)				
{0}	---	If TRUE, the gen-gen mode will be enabled. Prepared for: - Deactivated by default		**FALSE**
{1}	---			
{2}	✓			

	simple (function)	extended (configuration)	result

Source 1 priority
(parameter 12680 on page 46)

{0}	✓	If TRUE, source 1 is preferred. Prepared for: - Activated by default		TRUE
{1}	✓			
{2}	✓			

Source 2 priority
(parameter 12810 on page 47)

{0}	✓	If TRUE, source 2 is preferred. Prepared for: - Deactivated by default		FALSE
{1}	✓			
{2}	✓			

Extended parallel time
(parameter 12860 on page 49)

{0}	✓	If TRUE, the transfer switch remains in overlap position. Prepared for: - Deactivated by default		FALSE
{1}	---			
{2}	✓			

Load shed
(parameter 12870 on page 51)

{0}	✓	If TRUE, a load shed from the non-preferred source will be performed. Prepared for: - Deactivated by default		FALSE
{1}	---			
{2}	✓			

simple (function)	extended (configuration)	result

Delayed mode active
(parameter 12850 on page 59)

{0}	✓	If TRUE, the transfer switch type will be set to Delayed. Prepared for: - Deactivated by default		**FALSE**
{1}	✓			
{2}	✓			

Load test
(parameter 12640 on page 65)

{0}	✓	If TRUE, a load test will be performed. Prepared for: - Deactivated by default		**FALSE**
{1}	✓			
{2}	✓			

No load test
(parameter 12650 on page 65)

{0}	✓	If TRUE, a no-load test will be performed. Prepared for: - Deactivated by default		**FALSE**
{1}	✓			
{2}	✓			

		simple (function)	extended (configuration)	result
External acknowledge (parameter 12490 on page 70)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, alarms are acknowledged from an external source. Prepared for: - Remote acknowledgement		FALSE
Reset limit switch failure (parameter 12891 on page 67)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, limit switch failure is acknowledged from an external source.		FALSE

simple (function)	extended (configuration)	result

Factory Setting: Relay Outputs

Relay {x} [R0x]; {x} = 2 to 4 (parameters **Fehler! Verweisquelle konnte nicht gefunden werden.**, 12110, 12310, and 12320 on page **Fehler! Textmarke nicht definiert.**)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, relay 2 will be energized. Prepared for: - Deactivated by default		**FALSE**

Relay 5 [R05] (parameter 12130 on page 103)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, relay 5 will be energized. True, if the Source 2 start signal is issued		dependent on Logics Command Variable [20.06]

Relay 6 [R06] (parameter 12140 on page 103)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, relay 6 will be energized. True, if the command: Close to Source 1 is issued		dependent on Logics Command Variable [20.07]

Relay 7 [R07] (parameter 12150 on page 103)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, relay 7 will be energized. True, if the command: Close to Source 2 is issued		dependent on Logics Command Variable [20.09]

simple (function)	extended (configuration)	result

Relay 8 [R08]
(parameter 12160 on page 103)

{0}	✓	If TRUE, relay 8 will be energized. True, if the command: Open from Source 1 is issued		dependent on Logics Command Variable [20.08]
{1}	✓			
{2}	✓			

Relay 9 [R09]
(parameter 12170 on page 103)

{0}	✓	If TRUE, relay 9 will be energized. True, if the command: Open from Source 2 is issued		dependent on Logics Command Variable [20.10]
{1}	✓			
{2}	✓			

External discrete output {x} [REx{x}] - free (external expansion card, if connected; {x} = 1-16)
(refer to Table 3-12 on page 103 for the parameter IDs of the parameters for external DOs 1 through 16)

{0}	✓	If TRUE, the external relay {x} will be energized, if this is connected Prepared for: - Deactivated by default		FALSE
{1}	✓			
{2}	✓			

simple (function)	extended (configuration)	result

Factory Setting: Internal Flags

Internal flag {x}; {x} = 1 to 7 (refer to Table 3-13 on page 106 for the parameter IDs of the parameters for internal flags 1 through 7)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, the internal flag {x} will be enabled. Prepared for: - Deactivated by default **Note:** Internal flag 1 is used as default setting in all logical outputs.		FALSE

Internal flag 8 (parameter 12300 on page 106)				
{0} {1} {2}	✓ ✓ ✓	If TRUE, the internal flag 8 will be enabled. TRUE, once the configured time 1 has been reached [11.01], and the configured time 2 [11.02] has not been reached as well, if the current day is the configured day [11.03]		dependent on Logics Command Variables [11.01], [11.02], and [11.03]

Discrete Inputs

[D1]	{0} {1} {2}	Reply from ATS switch: Breaker in source 1 position
[D2]	{0} {1} {2}	Reply from ATS switch: Breaker in source 2 position
[D3]	{0} {1} {2}	Reply from ATS switch: Breaker in source 1 open position
[D4]	{0} {1} {2}	Reply from ATS switch: Breaker in source 2 open position
[D5]	{0} {1} {2}	freely configurable discrete input (pre-configured to Inhibit ATS)
[D6]	{0} {1} {2}	freely configurable discrete input (unassigned)
[D7]	{0} {1} {2}	freely configurable discrete input (unassigned)
[D8]	{0} {1} {2}	freely configurable discrete input (unassigned)
[D9]	{0} {1} {2}	freely configurable discrete input (unassigned)
[D10]	{0} {1} {2}	freely configurable discrete input (unassigned)
[D11]	{0} {1} {2}	freely configurable discrete input (unassigned)
[D12]	{0} {1} {2}	freely configurable discrete input (unassigned)

NOTE

The discrete inputs for the breaker position reply messages (DIs 1 through 4) are fixed to N.C. and are evaluated as N.C., i.e. the breaker is considered as "in position" if the respective DI is de-energized.

Appendix B.

Appendix C.
Service Options

Product Service Options

The following factory options are available for servicing Woodward equipment, based on the standard Woodward Product and Service Warranty (5-01-1205) that is in effect at the time the product is purchased from Woodward or the service is performed. If you are experiencing problems with installation or unsatisfactory performance of an installed system, the following options are available:

- Consult the troubleshooting guide in the manual.
- Contact Woodward technical assistance (see "How to Contact Woodward" later in this chapter) and discuss your problem. In most cases, your problem can be resolved over the phone. If not, you can select which course of action you wish to pursue based on the available services listed in this section.

Returning Equipment For Repair

If a control (or any part of an electronic control) is to be returned to Woodward for repair, please contact Woodward in advance to obtain a Return Authorization Number. When shipping the unit(s), attach a tag with the following information:

- name and location where the control is installed;
- name and phone number of contact person;
- complete Woodward part numbers (P/N) and serial number (S/N);
- description of the problem;
- instructions describing the desired repair.

CAUTION

To prevent damage to electronic components caused by improper handling, read and observe the precautions in Woodward manual 82715, *Guide for Handling and Protection of Electronic Controls, Printed Circuit Boards, and Modules.*

Packing A Control

Use the following materials when returning a complete control:

- protective caps on any connectors;
- antistatic protective bags on all electronic modules;
- packing materials that will not damage the surface of the unit;
- at least 100 mm (4 inches) of tightly packed, industry-approved packing material;
- a packing carton with double walls;
- a strong tape around the outside of the carton for increased strength.

Return Authorization Number RAN

When returning equipment to Woodward, please telephone and ask for the Customer Service Department in Stuttgart [+49 (0) 711 789 54-510]. They will help expedite the processing of your order through our distributors or local service facility. To expedite the repair process, contact Woodward in advance to obtain a Return Authorization Number, and arrange for issue of a purchase order for the unit(s) to be repaired. No work can be started until a purchase order is received.

NOTE

We highly recommend that you make arrangement in advance for return shipments. Contact a Woodward customer service representative at +49 (0) 711 789 54-510 for instructions and for a Return Authorization Number.

Replacement Parts

When ordering replacement parts for controls, include the following information:

- the part numbers P/N (XXXX-XXX) that is on the enclosure nameplate;
- the unit serial number S/N, which is also on the nameplate.

How To Contact Woodward

Please contact following address if you have questions or if you want to send a product for repair:

Woodward GmbH
Handwerkstrasse 29
70565 Stuttgart - Germany

Phone: +49 (0) 711 789 54-510 (8.00 - 16.30 German time)
Fax: +49 (0) 711 789 54-101
e-mail: marketing_pg@woodward.com

For assistance outside Germany, please consult our worldwide directory on Woodward's website (**www.woodward.com**) for the name of your nearest Woodward distributor or service facility.
[For worldwide directory information, go to **www.woodward.com/ic/locations**.]

Engineering Services

Woodward Industrial Controls Engineering Services offers the following after-sales support for Woodward products. For these services, you can contact us by telephone, by e-mail, or through the Woodward website.

- Technical support
- Product training
- Field service during commissioning

Technical Support is available through our many worldwide locations, through our authorized distributors, depending on the product. This service can assist you with technical questions or problem solving during normal business hours. For technical engineering support, please contact us via our local phone numbers, e-mail us, or use our website and reference technical support.

Product Training is available on-site from several of our worldwide facilities or at your location, depending on the product. This training, conducted by experienced personnel, will assure that you will be able to maintain system reliability and availability. For information concerning training, please contact us via our local phone numbers, e-mail us, or use our website and reference ***customer training***.

Field Service engineering on-site support is available, depending on the product and location, from one of many worldwide Woodward offices or authorized distributors. Field engineers are experienced on both Woodward products as well as on much of the non-Woodward equipment with which our products interface. For field service engineering assistance, please contact us via our local phone numbers, e-mail us, or use our website and reference ***field service***.
